The current version of SUEWS is v2017b. The software can be downloaded by completing this form.

This documentation site (page ??) is regularly updated with new developments. For what's new in this version, see New in SUEWS Version 2018a (page 175).

The latest formal release of SUEWS is v2017b (released 1 August 2017).

The manual for SUEWS v2017b can be accessed here and should be referenced as follows:

Ward HC, L Järvi, T Sun, S Onomura, F Lindberg, F Olofson, A Gabey, CSB Grimmond (2017). SUEWS Manual V2017b Department of Meteorology, University of Reading, Reading, UK

Please refer to Ward et al. (2017) for further details v2017a:

INTRODUCTION

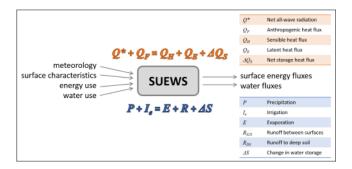

Fig. 2.1: Overview of SUEWS

Surface Urban Energy and Water Balance Scheme (**SUEWS**) (Järvi et al. 2011 [J11] (page 183), Ward et al. 2016 [W16] (page 183)) is able to simulate the urban radiation, energy and water balances using only commonly measured meteorological variables and information about the surface cover. SUEWS utilizes an evaporation-interception approach (Grimmond et al. 1991 [G91] (page 183)), similar to that used in forests, to model evaporation from urban surfaces.

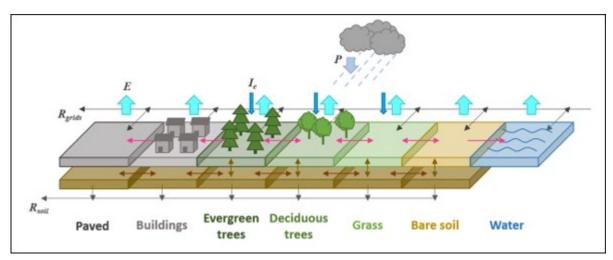

Fig. 2.2: The seven surface types considered in SUEWS

The model uses seven surface types: paved, buildings, evergreen trees/shrubs, deciduous trees/shrubs, grass, bare soil and water. The surface state for each surface type at each time step is calculated from the running water balance of the canopy where the evaporation is calculated from the Penman-Monteith equation. The soil moisture below each surface type (excluding water) is taken into account.

Horizontal movement of water above and below ground level is allowed. The user can specify the model time-step, but 5 min is strongly recommended. The main output file is provided at a resolution of 60 min by default. The model provides the radiation and energy balance components, surface and soil wetness, surface and soil runoff and the drainage for each surface. Timestamps refer to the end of the averaging period.

Model applicability: SUEWS is a neighbourhood-scale or local-scale model.

CHAPTER

THREE

SUEWS AND UMEP

SUEWS can be run as a standalone model but also can be used within UMEP. There are numerous tools included within UMEP to help a user get started. The SUEWS simple within UMEP is a fast way to start using SUEWS.

The version of SUEWS within UMEP is the complete model. Thus all options that are listed in this manual are available to the user. In the UMEP SUEWS simple runs all options are set to values to allow intial exploration of the model behaviour.

The version of SUEWS within UMEP is a more recent release of the model than the independent SUEWS release.

PARAMETERISATIONS AND SUB-MODELS WITHIN SUEWS

4.1 Net all-wave radiation, Q*

There are several options for modelling or using observed radiation components depending on the data available. As a minimum, SUEWS requires incoming shortwave radiation to be provided.

- 1. Observed net all-wave radiation can be provided as input instead of being calculated by the model.
- 2. Observed incoming shortwave and incoming longwave components can be provided as input, instead of incoming longwave being calculated by the model.
- 3. Other data can be provided as input, such as cloud fraction (see options in RunControl (page ??)).
- 4. NARP (Net All-wave Radiation Parameterization, Offerle et al. 2003 [O2003] (page 183), Loridan et al. 2011 [L2011] (page 183)) scheme calculates outgoing shortwave and incoming and outgoing longwave radiation components based on incoming shortwave radiation, temperature, relative humidity and surface characteristics (albedo, emissivity).

4.2 Anthropogenic heat flux, Q_F

- 1. Two simple anthropogenic heat flux sub-models exist within SUEWS:
 - Järvi et al. (2011) [J11] (page 183) approach, based on heating and cooling degree days and population density (allows distinction between weekdays and weekends).
 - Loridan et al. (2011) [L2011] (page 183) approach, based on a linear piece-wise relation with air temperature.
- 2. Pre-calculated values can be supplied with the meteorological forcing data, either derived from knowledge of the study site, or obtained from other models, for example:
 - LUCY (Allen et al. 2011 [lucy] (page 183), Lindberg et al. 2013 [lucy2] (page 183)). A new version has been now included in UMEP. To distinguish it is referred to as **LQF**
 - GreaterQF (Iamarino et al. 2011 [I11] (page 183)). A new version has been now included in UMEP. To distinguish it is referred to as **GQF**

4.3 Storage heat flux, ΔQ_S

1. Three sub-models are available to estimate the storage heat flux:

- **OHM** (Objective Hysteresis Model, Grimmond et al. 1991 [G910HM] (page 183), Grimmond & Oke 1999a [G099QS] (page 183), 2002 [G02002] (page 183)). Storage heat heat flux is calculated using empirically-fitted relations with net all-wave radiation and the rate of change in net all-wave radiation.
- **AnOHM** (Analytical Objective Hysteresis Model, Sun et al. 2017 [AnOHM17] (page 183)). OHM approach using analytically-derived coefficients. (Not recommended in v2017b)
- **ESTM** (Element Surface Temperature Method, Offerle et al. 2005 [Oaf2005] (page 183)). Heat transfer through urban facets (roof, wall, road, interior) is calculated from surface temperature measurements and knowledge of material properties. (Not recommended in v2017b)
- 2. Alternatively, 'observed' storage heat flux can be supplied with the meteorological forcing data.

4.4 Turbulent heat fluxes, Q_H and Q_E

- 1. **LUMPS** (Local-scale Urban Meteorological Parameterization Scheme, Grimmond & Oke 2002 [GO2002] (page 183)) provides a simple means of estimating sensible and latent heat fluxes based on the proportion of vegetation in the study area.
- 2. **SUEWS** adopts a more biophysical approach to calculate the latent heat flux; the sensible heat flux is then calculated as the residual of the energy balance. The initial estimate of stability is based on the LUMPS calculations of sensible and latent heat flux. Future versions will have alternative sensible heat and storage heat flux options.

Sensible and latent heat fluxes from both LUMPS and SUEWS are provided in the *Output files* (page 157). Whether the turbulent heat fluxes are calculated using LUMPS or SUEWS can have a major impact on the results. For SUEWS, an appropriate surface conductance parameterisation is also critical [J11] (page 183) [W16] (page 183). For more details see *Differences between SUEWS*, LUMPS and FRAISE (page ??).

4.5 Water balance

The running water balance at each time step is based on the urban water balance model of Grimmond et al. (1986) [G86] (page 183) and urban evaporation-interception scheme of Grimmond and Oke (1991) [G91] (page 183).

- Precipitation is a required variable in the meteorological forcing file.
- Irrigation can be modelled [J11] (page 183) or observed values can be provided if data are available.
- Drainage equations and coefficients to use must be specified in the input files.
- Soil moisture can be calculated by the model (Use of observed soil moisture is not possible in v2017b).
- Runoff is permitted:
 - between surface types within each model grid
 - between model grids (Not implemented in v2017b)
 - to deep soil
 - to pipes.

4.6 Snowmelt

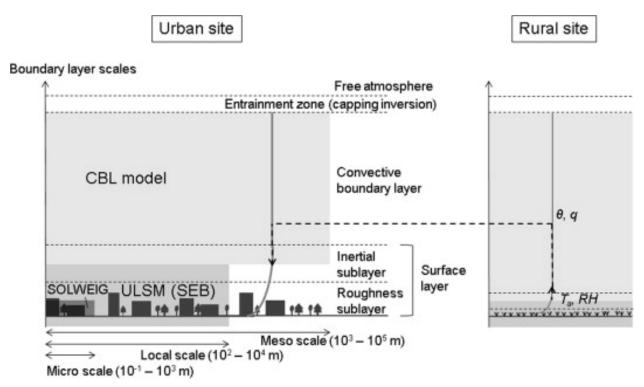

The snowmelt model within SUEWS is described in Järvi et al. (2014) [Leena2014] (page 184). Due to changes in the new model version (since v2016a) when compared to the older versions, the snow calculation has slightly changed. The main difference is that previously all surface state could freeze in 1-h time step but now the amount of freezing surface state is calculated similar way as melt water can freeze within the snow pack. Also the snowmelt-related coefficients have slightly changed (see SUEWS Snow.txt (page ??)).

4.7 Convective boundary layer

A convective boundary layer (CBL) slab model (Cleugh and Grimmond 2001 [CG2001] (page 184)) calculates the CBL height, temperature and humidity during daytime (Onomura et al. 2015 [Shiho2015] (page 184)).

4.8 Thermal comfort

SOLWEIG (Solar and longwave environmental irradiance geometry model, Lindberg et al. 2008 [FL2008] (page 184), Lindberg and Grimmond 2011 [FL2011] (page 184)) is a 2D radiation model to estimate mean radiant temperature.

4.6. Snowmelt

PREPARING TO RUN THE MODEL

The following is to help with the model setup. Note that there is a version of SUEWS in UMEP and there are some starting tutorials for that. The version there is the same (i.e. the executable) as the standalone version so you can swap to that later once you have some familiarity.

5.1 Preparatory reading

Read the manual and relevant papers (and references therein):

- Järvi L, Grimmond CSB & Christen A (2011) The Surface Urban Energy and Water Balance Scheme (SUEWS): Evaluation in Los Angeles and Vancouver. J. Hydrol. 411, 219-237. doi:10.1016/j.jhydrol.2011.10.00
- Järvi L, Grimmond CSB, Taka M, Nordbo A, Setälä H & Strachan IB (2014) Development of the Surface Urban Energy and Water balance Scheme (SUEWS) for cold climate cities. Geosci. Model Dev. 7, 1691-1711. doi:10.5194/gmd-7-1691-2014
- Ward HC, Kotthaus S, Järvi L and Grimmond CSB (2016) Surface Urban Energy and Water Balance Scheme (SUEWS): development and evaluation at two UK sites. Urban Climate 18, 1-32. doi:10.1016/j.uclim.2016.05.001

See other publications with example applications

5.2 Decide what type of model run you are interested in

| | Available in this release |
|--|---------------------------|
| LUMPS | Yes – not standalone |
| SUEWS at a point or for an individual area | Yes |
| SUEWS for multiple grids or areas | Yes |
| SUEWS with Boundary Layer (BL) | Yes |
| SUEWS with snow | Yes |
| SUEWS with SOLWEIG | No |
| SUEWS with SOLWEIG and BL | No |

5.3 Download the program and example data files

Visit the website to receive a link to download the program and example data files. Select the appropriate compiled version of the model to download. For windows there is an installation version which will put the

programs and all the files into the appropriate place. There is also a version linked to QGIS: **UMEP**.

Note, as the definition of long double precision varies between computers (e.g. Mac vs Windows) slightly different results may occur in the output files.

Test/example files are given for the London KCL site, 2011 data (denoted Kc11)

In the following SS is the site code (e.g. Kc), so the grid ID, YYYY the year and tt the time interval.

| Filename | Description | Input/output |
|-----------------------|-----------------------|------------------------------------|
| SSss_data.txt | Meteorological input | Input file (60-min) |
| SSss_YYYY_data_5.txt | Meteorological input | Input file (5-min) |
| InitialConditionsSSss | Initial conditions | InputYYYY.nml(+) file |
| SUEWS_SiteInfo_SSss.x | Spreadsheet | Input lsm containing all other in- |
| | | put information |
| RunControl.nml | Sets model run | Input (located in options main di- |
| | | rectory) |
| SS_Filechoices.txt | Summary of model run | Output options |
| SSss_YYYY_5.txt | (Optional) 5-min | Output resolution output file |
| SSss_YYYY_60.txt | 60-min resolution | Output output file |
| SSss_DailyState.txt | Daily state variables | Output (all years in one file) |

(+) There is a second file InitialConditionsSSss_YYYY_EndOfRun.nml or InitialConditionsSSss_YYYY+1.nml in the input directory. At the end of the run, and at the end of each year of the run, these files are written out so that this information could be used to initialize further model runs.

5.4 Run the model for example data

Before running the model for your own data it is good to make certain that you can run the test data and get the same results as in the example files provided. It is recommended that you make a copy of the example output files and put them somewhere else so you can compare the results. When you run the program it will write over the supplied files.

To run the model you can use **Command Prompt** (in the directory where the programme is located type the model name) or just double click the executable file.

Please see *Troubleshooting* (page ??) if you have problems running the model.

5.5 Preparation of data

This section describes the information required to run SUEWS for your site. The input data can be summarised as follows:

- 1. Continuous meteorological forcing data for the entire period to be modelled. Note you can not have gaps in the meteorological data. If you need help with preparing the data you may want to use some of the tools in UMEP.
- 2. Knowledge of the surface and soil conditions immediately before the start of the run (if these initial conditions are not known, it is usually possible to determine suitable values by running the model and using the output at the end of the run to infer the conditions at the start of the run).
- 3. The location of the site (latitude, longitude, altitude).

- 4. Information about the *characteristics of the surface*, including land cover, heights of buildings and trees, radiative characteristics (e.g. albedo, emissivity), drainage characteristics, soil characteristics, snow characteristics, phenological characteristics (e.g. seasonal cycle of LAI).
- 5. Information about *human behaviour*, including energy use and water use (e.g. for irrigation or street cleaning) and snow clearing (if applicable). The anthropogenic energy use and water use may be provided as a time series in the meteorological forcing file if these data are available or modelled based on parameters provided to the model, including population density, hourly and weekly profiles of energy and water use, information about the proportion of properties using irrigation and the type of irrigation (automatic or manual).

It is particularly important to ensure the following input information is appropriate and representative of the site:

- Fractions of different land cover types and (less so) heights of buildings [W16] (page 183)
- Accurate meteorological forcing data, particularly precipitation and incoming shortwave radiation [Ko17] (page 184)
- Initial soil moisture conditions [Best2014] (page 184)
- Anthropogenic heat flux parameters, particularly if there are considerable energy emissions from transport, buildings, metabolism, etc [W16] (page 183)
- External water use (if irrigation or street cleaning occurs)
- Snow clearing (if running the snow option)
- Surface conductance parameterisation [J11] (page 183) [W16] (page 183)

SUEWS can be run either for an individual area or for multiple areas. There is no requirement for the areas to be of any particular shape but here we refer to them as model 'grids'.

5.5.1 Preparation of site characteristics and model parameters

The area to be modelled is described by a set of characteristics that are specified in the SUEWS_SiteSelect.txt (page ??) file. Each row corresponds to one model grid for one year (i.e. running a single grid over three years would require three rows; running two grids over two years would require four rows). Characteristics are often selected by a code for a particular set of conditions. For example, a specific soil type (links to SUEWS_Soil.txt (page ??)) or characteristics of deciduous trees in a particular region (links to SUEWS_Veg.txt (page ??)). The intent is to build a library of characteristics for different types of urban areas. The codes are specified by the user, must be integer values and must be unique within the first column of each input file, otherwise the model will return an error. (Note in SUEWS_SiteSelect.txt (page ??) the first column is labelled 'Grid' and can contain repeat values for different years.) See Input files (page ??) for details. Note UMEP maybe helpful for components of this.

Land cover

For each grid, the land cover must be classified using the following surface types:

| Classification | Surface type | File where characteristics are specified |
|----------------|-----------------|--|
| Non-vegetated | Paved surfaces | SUEWS_NonVeg.txt (page 36) |
| | Building | SUEWS_NonVeg.txt (page 36) |
| | Bare soil | SUEWS_NonVeg.txt (page 36) |
| Vegetation | Evergreen trees | SUEWS_Veg.txt (page 50) |
| | Deciduous trees | SUEWS_Veg.txt (page 50) |
| | Grass | SUEWS_Veg.txt (page 50) |
| Water | Water | SUEWS_Water.txt (page 53) |
| Snow | Snow | SUEWS_Snow.txt (page 46) |

The surface cover fractions (i.e. proportion of the grid taken up by each surface) must be specified in $SUEWS_SiteSelect.txt$ (page 39). The surface cover fractions are **critical**, so make certain that the different surface cover fractions are appropriate for your site.

For some locations, land cover information may be already available (e.g. from various remote sensing resources). If not, websites like Bing Maps and Google Maps allow you to see aerial images of your site and can be used to estimate the relative proportion of each land cover type. If detailed spatial datasets are available, UMEP allows for a direct link to a GIS environment using QGIS.

Anthropogenic heat flux (Q F)

You can either model Q_F within SUEWS or provide it as an input.

- To model it population density is needed as an input for LUMPS and SUEWS to calculate Q_F.
- If you have no information about the population of the site we recommend that you use the LUCY model [lucy] (page 183) [lucy2] (page 183) to estimate the anthropogenic heat flux which can then be provided as input SUEWS along with the meteorological forcing data. The LUCY model can be downloaded from here.

Alternatively, you can use the updated version of LUCY called LQF, which is included in UMEP.

Other information

The surface cover fractions and population density can have a major impact on the model output. However, it is important to consider the suitability of all parameters for your site. Using inappropriate parameters may result in the model returning an error or, worse, generating output that is simply not representative of your site. Please read the section on *Input files* (page ??). Recommended or reasonable ranges of values are suggested for some parameters, along with important considerations for how to select appropriate values for your site.

Data Entry

To create the series of input text files describing the characteristics of your site, there are three options:

- 1. Data can be entered directly into the input text files. The example (.txt) files provide a template to create your own files which can be edited with a *text editor* (page ??) directly.
- 2. Data can be entered into the spreadsheet **SUEWS_SiteInfo.xlsm** and the input text files generated by running the macro.
- 3. Use [http://urban-climate.net/umep/UMEP] UMEP].

To run the xlsm macro: Enter the data for your site into the xlsm spreadsheet SUEWS_SiteInfo.xlsm and then use the macro to create the text files which will appear the same directory.

If there is a problem

- Make sure none of the text files to be generated are open.
- It is recommended to close the spreadsheet before running the actual model code.

Note that in all txt files:

- The first two rows are headers. The first row is the column number; the second row is the column name.
- The names and order of the columns should not be altered from the templates, as these are checked by the model and errors will be returned if particular columns cannot be found.
- Since v2017a it is no longer necessary for the meteorological forcing data to have two rows with -9 in column 1 as their last two rows.
- "!" indicates a comment, so any text following "!" on the same line will not be read by the model.
- If data are unavailable or not required, enter the value -999 in the correct place in the input file.
- Ensure the units are correct for all input information. See *Input files* (page ??) for a description of parameters.

In addition to these text files, the following files are also needed to run the model.

5.5.2 Preparation of the RunControl file

In the RunControl.nml file the site name (SS_) and directories for the model input and output are given. This means **before running** the model (even the with the example datasets) you must either

- 1. open the RunControl.nml file and edit the input and output file paths and the site name (with a text editor (page ??)) so that they are correct for your setup, or
- 2. create the directories specified in the RunControl.nml file

From the given site identification the model identifies the input files and generates the output files. For example if you specify:

```
FileOutputPath = "C:\FolderName\SUEWSOutput\"
```

and use site code SS the model creates an output file:

C:\FolderName\SUEWSOutput\SSss_YYYY_TT.txt

Note: remember to add the last backslash in windows and slash in Linux/Mac

If the file paths are not correct the program will return an error when run (see *error messages* (page ??)) and write the error to the problems.txt file.

5.5.3 Preparation of the Meteorological forcing data

The model time-step is specified in *RunControl.nml* (page ??) (5 min is highly recommended). If meteorological forcing data are not available at this resolution, SUEWS has the option to downscale (e.g. hourly) data to the time-step required. See details about the *meteorological forcing data* (page ??) to learn more

about choices of data input. Each grid can have its own meteorological forcing file, or a single file can be used for all grids. The forcing data should be representative of the local-scale, i.e. collected (or derived) above the height of the roughness elements (buildings and trees).

5.5.4 Preparation of the InitialConditions file

Information about the surface state and meteorological conditions just before the start of the run are provided in the Initial Conditions file. At the very start of the run, each grid can have its own Initial Conditions file, or a single file can be used for all grids. For details see *InitialConditions* (page ??).

5.6 Run the model for your site

To run the model you can use **Command Prompt** (in the directory where the programme is located type the model name) or just double click the executable file.

Please see *Troubleshooting* (page ??) if you have problems running the model.

5.7 Analyse the output

It is a good idea to perform initial checks that the model output looks reasonable.

| Characteristic | Things to check | |
|-----------------|---|-----|
| Leaf area index | Does the phenologylook appropriate (i.e. what does the seasonal cycle of leaf area in • Are the leaves on the trees at approximately the right time of the year? | nde |
| Kdown | Although Kdown is a required input, it is also included in the output file. It is a good idea to check that the timing of Kdown in the output file is appropriate, as problems can indicate errors with the timestamp, incorrect time settings or problems with the disaggregation. In particular, make sure the sign of the longitude is specified correctly in SUEWS_SiteSelect.txt (page 39). Checking solar angles (zenith and azimuth) can also be a useful check that the timing is correct. | |
| Albedo | Is the bulk albedo correct? This is critical because a small error has an impact on all the fluxes (energy and hydrology). If you have measurements of outgoing shortwave radiation compare these with the modelled values. How do the values compare to literature values for your area? | |

5.8 Summary of files

The table below lists the files required to run SUEWS and the output files produced. SS is the two-letter code (specified in RunControl) representing the site name, ss is the grid identification (integer values between 0 and 2,147,483,647 (largest 4-byte integer)) and YYYY is the year. TT is the resolution of the input/output file and tt is the model time-step.

The last column indicates whether the files are needed/produced once per run (1/run), or once per day (1/day), for each year (1/year) or for each grid (1/grid):

- [B] indicates files used with the CBL part of SUEWS (BLUEWS) and therefore are only needed/ \rightarrow produced if this option is selected``
- [E] indicates files associated with ESTM storage heat flux models and therefore are only needed/

 produced if this option is selected`

CHAPTER

SIX

INPUT FILES

SUEWS allows you to input a large number of parameters to describe the characteristics of your site. You should not assume that the example values provided in files or in the tables below are appropriate. Values marked with 'MD' are examples of recommended values (see the suggested references to help decide how appropriate these are for your site/model domain); values marked with 'MU' need to be set (i.e. changed from the example) for your site/model domain.

6.1 RunControl.nml

The file **RunControl.nml** is a namelist that specifies the options for the model run. It must be located in the same directory as the executable file.

A sample file of RunControl.nml looks like

```
&RunControl
CBLUse=0
SnowUse=0
SOLWEIGUse=0
NetRadiationMethod=3
EmissionsMethod=2
StorageHeatMethod=3
OHMIncQF=0
StabilityMethod=2
RoughLenHeatMethod=2
RoughLenMomMethod=2
SMDMethod=0
WaterUseMethod=0
FileCode='Saeve'
FileInputPath="./Input/"
FileOutputPath="./Output/"
MultipleMetFiles=0
MultipleInitFiles=0
MultipleESTMFiles=1
KeepTstepFilesIn=1
KeepTstepFilesOut=1
WriteOutOption=2
ResolutionFilesOut=3600
Tstep=300
ResolutionFilesIn=3600
ResolutionFilesInESTM=3600 !NEW
                        !NEW (1 = default value, so don't actually need here)
DisaggMethod=1
RainDisaggMethod=100
                        !NEW (100 = default value, so don't actually need here)
DisaggMethodESTM=1
                              (1 = default value, so don't actually need here)
```

(continues on next page)

(continued from previous page)

```
SuppressWarnings=1 !NEW
KdownZen=0
diagnose=0
/
```

Note:

- In Linux and Mac, please add an empty line after the end slash.
- The file is not case-sensitive.
- The parameters and variables can appear in any order.

The parameters and their setting instructions are provided through the links below:

6.1.1 Model run options

CBLuse

Requirement Required

Description Determines whether a CBL slab model is used to calculate temperature and humidity.

Configuration

| Value | Comments |
|-------|---|
| 0 | CBL model not used. SUEWS and LUMPS use temperature and humidity provided in the meteorological forcing file. |
| 1 | CBL model is used to calculate temperature and humidity used in SUEWS and LUMPS. |

SnowUse

Requirement Required

Description Determines whether the snow part of the model runs.

Configuration

| Value | Comments |
|-------|--------------------------------------|
| 0 | |
| | Snow calculations are not performed. |
| 1 | Snow calculations are performed. |

SOLWEIGUse

Requirement Required

Description Determines whether a high resolution radiation model to calculate mean radiant temperate should be used (SOLWEIG). NOTE: this option will considerably slow down the model since SOLWEIG is a 2D model.

Configuration

6.1. RunControl.nml 23

| Value | Comments |
|-------|--|
| 0 | SOLWEIG calculations are not performed. |
| 1 | SOLWEIG calculations are performed. A grid of mean radiant temperature (Tmrt) is calculated based on high resolution digital surface models. |

${\tt NetRadiationMethod}$

Requirement Required

Description Determines method for calculation of radiation fluxes.

Configuration

| Value | Comments |
|-------|---|
| 0 | |
| | Uses observed values of Q* supplied in meteorological forc- |
| | ing file. |
| | |
| 1 | Q^* modelled with $L\downarrow$ observations supplied in meteorological forcing |
| | file. Zenith angle not accounted for in albedo calculation. |
| 2 | Q^* modelled with $L\downarrow$ modelled using cloud cover fraction supplied |
| | in meteorological forcing file (Loridan et al. 2011 [5]). Zenith angle |
| | not accounted for in albedo calculation. |
| 3 | Q* modelled with L↓ modelled using air temperature and relative |
| | humidity supplied in meteorological forcing file (Loridan et al. 2011 |
| | [5]). Zenith angle not accounted for in albedo calculation. |
| 100 | Q^* modelled with $L\downarrow$ observations supplied in meteorological |
| | forcing file. Zenith angle accounted for in albedo calculation. |
| | SSss_YYYY_NARPOut.txt file produced. Not recommended in |
| | this release |
| 200 | Q* modelled with L↓ modelled using cloud cover fraction supplied |
| | in meteorological forcing file (Loridan et al. 2011 [5]). Zenith angle |
| | accounted for in albedo calculation. SSss_YYYY_NARPOut.txt |
| | file produced. Not recommended in this release |
| 300 | Q* modelled with L↓ modelled using air temperature and rela- |
| | tive humidity supplied in meteorological forcing file (Loridan et |
| | al. 2011 [5]). Zenith angle accounted for in albedo calculation. |
| | SSss_YYYY_NARPOut.txt file produced. Not recommended in |
| | this release |

${\tt AnthropHeatMethod}$

 ${\bf Requirement} \ \ {\rm Required}$

Description Determines method for QF calculation.

Configuration

| Value | Comments |
|-------|--|
| 0 | Uses values provided in the meteorological forcing file |
| | (SSss_YYYY_data_tt.txt). If you do not want to include |
| | QF to the calculation of surface energy balance, you should |
| | set values in the meteorological forcing file to zero to prevent |
| | calculation of QF. UMEP provides two methods to calculate QF |
| | LQF which is simpler GQF which is more complete but requires |
| | more data inputs |
| 1 | Currently not recommended! Calculated according to |
| | Loridan et al. (2011) [5] using coefficients specified in |
| | SUEWS_AnthropogenicHeat.txt. Modelled values will be used |
| | even if QF is provided in the meteorological forcing file. |
| 2 | Recommended Calculated according to Järvi et al. (2011) [1] using |
| | coefficients specified in SUEWS_AnthropogenicHeat.txt and diur- |
| | nal patterns specified in SUEWS_Profiles.txt. Modelled values will |
| | be used even if QF is provided in the meteorological forcing file. |

${\tt AnthropCO2Method}$

Requirement Required

Description Determines method for CO2 calculation.

Configuration

| Value | Comments |
|-------|---|
| 1 | |
| | Not used. |
| | |
| 2 | Under development - not recommended in v2017b Calculate CO2 |
| | emissions from traffic based on QF calculation. |
| 3 | Under development - not recommended in v2017b Calculate CO2 |
| | emissions from traffic from input data provided. |

${\tt StorageHeatMethod}$

 ${\bf Requirement} \ \ {\rm Required}$

Description Determines method for calculating storage heat flux ΔQS .

Configuration

| Value | Comments |
|-------|--|
| 1 | ΔQS modelled using the objective hysteresis model (OHM) [9] [10] |
| | [11] using parameters specified for each surface type. |
| 2 | Uses observed values of ΔQS supplied in meteorological forcing file. |
| 3 | ΔQS modelled using AnOHM. Not available in v2017b |
| 4 | ΔQS modelled using the Element Surface Temperature Method |
| | (ESTM) (Offerle et al. 2005 [13]). Not recommended in v2017b |

${\tt OHMIncQF}$

Requirement Required

Description Determines whether the storage heat flux calculation uses Q^* or (Q^*+QF) .

6.1. RunControl.nml 25

Configuration

| Value | Comments |
|-------|---------------------------------------|
| 0 | |
| | ΔQS modelled Q^* only. |
| | |
| 1 | |
| | ΔQS modelled using Q^*+QF . |
| | |

StabilityMethod

Requirement Required

Description Defines which atmospheric stability functions are used.

Configuration

| Value | Comments |
|-------|--|
| 0 | |
| | Not used. |
| 1 | |
| 1 | |
| | Not used. |
| | D (407) [00] |
| 2 | Recommended Momentum - unstable: Dyer (1974) [22] modified by |
| | Högstrom (1988) [23] ; stable: Van Ulden and Holtslag (1985) [24] |
| | Heat - Dyer (1974) [22] modified by Högstrom (1988) [23] |
| 3 | Momentum: Campbell and Norman (Eq 7.27, Pg97) [25] Heat - |
| | unstable: Campbell and Norman [25]; stable: Dyer (1974) [22] |
| | modified by Högstrom (1988) [23] |
| 4 | Momentum: Businger et al. (1971) [26] modified by Högstrom |
| | (1988) [23] Heat: Businger et al. (1971) [26] modified by Högstrom |
| | (1988) [23] |

${\tt RoughLenHeatMethod}$

Requirement Required

Description Determines method for calculating roughness length for heat.

Configuration

| Value | Comments |
|-------|--|
| 1 | Uses value of 0.1z0m. |
| 2 | Recommended Calculated according to Kawai et al. (2009) [27] . |
| 3 | Calculated according to Voogt and Grimmond (2000) [28] . |
| 4 | Calculated according to Kanda et al. (2007) [29] . |

${\tt RoughLenMomMethod}$

Requirement Required

Description Determines how aerodynamic roughness length (z0m) and zero displacement height (zdm) are calculated.

Configuration

| Value | Comments |
|-------|--|
| 1 | Values specified in SUEWS_SiteSelect.txt are used. Note that |
| | UMEP provides tools to calculate these]. See Kent et al. (2017a) |
| | for recommendations on methods. Kent et al. (2017b) have devel- |
| | oped a method to include vegetation which is also available within |
| | UMEP. Kent CW, CSB Grimmond, J Barlow, D Gatey, S Kot- |
| | thaus, F Lindberg, CH Halios 2017a: Evaluation of urban local- |
| | scale aerodynamic parameters: implications for the vertical profile |
| | of wind and source areas Boundary Layer Meteorology 164,183–213 |
| | doi: 10.1007/s10546-017-0248-z Kent CW, S Grimmond, D Gatey |
| | 2017b: Aerodynamic roughness parameters in cities: inclusion of |
| | vegetation Journal of Wind Engineering & Industrial Aerodynam- |
| | ics http://dx.doi.org/10.1016/j.jweia.2017.07.016 |
| 2 | z0m and zd are calculated using 'rule of thumb' (Grimmond and |
| | Oke 1999 [30]) using mean building and tree height specified in |
| | SUEWS_SiteSelect.txt . z0m and zd are adjusted with time to |
| | account for seasonal variation in porosity of deciduous trees. |
| 3 | z0m and zd are calculated based on the MacDonald et al. (1998) |
| | [31] method using mean building and tree heights, plan area fraction |
| | and frontal areal index specified in SUEWS_SiteSelect.txt . z0m |
| | and zd are adjusted with time to account for seasonal variation in |
| | porosity of deciduous trees. |

${\tt SMDMethod}$

Requirement Required

Description Determines method for calculating soil moisture deficit (SMD).

Configuration

| Value | Comments |
|-------|---|
| 0 | Recommended SMD modelled using parameters specified in |
| | SUEWS_Soil.txt . |
| 1 | Not currently implemented - do not use! Observed SM provided in the meteorological forcing file is used. Data are provided as volumetric soil moisture content. Metadata must be provided in SUEWS_Soil.txt. |
| 2 | Not currently implemented - do not use! Observed SM provided in the meteorological forcing file is used. Data are provided as gravimetric soil moisture content. Metadata must be provided in SUEWS_Soil.txt. |

WaterUseMethod

 ${\bf Requirement} \ \ {\rm Required}$

Description Defines how external water use is calculated.

Configuration

6.1. RunControl.nml 27

| Value | Comments |
|-------|--|
| 0 | External water use modelled using parameters specified in SUEWS_Irrigation.txt . |
| 1 | Observations of external water use provided in the meteorological forcing file are used. |

6.1.2 Time related options

Tstep

Requirement Required

Description Specifies the model time step [s]. A value of 300 s (5 min) is strongly recommended. The time step cannot be less than 1 min or greater than 10 min, and must be a whole number of minutes that divide into an hour (i.e. options are 1, 2, 3, 4, 5, 6, 10 min or 60, 120, 180, 240, 300, 360, 600 s).

Configuration to fill

ResolutionFilesIn

Requirement Required

Description Specifies the resolution of the input files [s] which SUEWS will disaggregate to the model time step. 1800 s for 30 min or 3600 s for 60 min are recommended. (N.B. if ResolutionFilesIn is not provided, SUEWS assumes ResolutionFilesIn = Tstep.)

Configuration to fill

ResolutionFilesInESTM

Requirement Optional

Description Specifies the resolution of the ESTM input files [s] which SUEWS will disaggregate to the model time step.

Configuration to fill

ResolutionFilesOut

Requirement Required

Description Specifies the resolution of the output files [s]. 1800 s for 30 min or 3600 s for 60 min are recommended.

Configuration to fill

6.1.3 File related options

FileCode

Requirement Required

Description Two-letter site identification code (e.g. He, Sc, Kc).

Configuration to fill

FileInputPath

Requirement Required

Description Input directory.

Configuration to fill

FileOutputPath

Requirement Required

Description Output directory.

Configuration to fill

MultipleMetFiles

Requirement Required

Description Specifies whether one single meteorological forcing file is used for all grids or a separate met file is provided for each grid.

Configuration

| Value | Comments |
|-------|---|
| 0 | Single meteorological forcing file used for all grids. No grid number |
| | should appear in the file name. |
| 1 | Separate meteorological forcing files used for each grid. The grid |
| | number should appear in the file name. |

MultipleInitFiles

Requirement Required

Description Specifies whether one single initial conditions file is used for all grids at the start of the run or a separate initial conditions file is provided for each grid.

Configuration

| Value | Comments |
|-------|--|
| 0 | Single initial conditions file used for all grids. No grid number should |
| | appear in the file name. |
| 1 | Separate initial conditions files used for each grid. The grid number |
| | should appear in the file name. |

${\tt MultipleESTMFiles}$

Requirement Optional

Description Specifies whether one single ESTM forcing file is used for all grids or a separate file is provided for each grid.

Configuration

| Value | Comments |
|-------|--|
| 0 | Single ESTM forcing file used for all grids. No grid number should |
| | appear in the file name. |
| 1 | Separate ESTM forcing files used for each grid. The grid number |
| | should appear in the file name. |

6.1. RunControl.nml 29

${\tt KeepTstepFilesIn}$

Requirement Optional

Description Specifies whether input meteorological forcing files at the resolution of the model time step should be saved.

Configuration

| Value | Comments |
|-------|--|
| 0 | Meteorological forcing files at model time step are not written out. |
| | This is the default option Recommended to reduce processing time |
| | and save disk space as (e.g. 5-min) files can be large. |
| 1 | Meteorological forcing files at model time step are written out. |

KeepTstepFilesOut

Requirement Optional

Description Specifies whether output meteorological forcing files at the resolution of the model time step should be saved.

Configuration

| Value | Comments |
|-------|---|
| 0 | Output files at model time are not saved. This is the default option. |
| | Recommended to save disk space as (e.g. 5-min) files can be large. |
| 1 | Output files at model time step are written out. |

WriteOutOption

Requirement Optional

Description Specifies which variables are written in the output files.

Configuration

| Value | Comments |
|-------|--|
| 0 | All (except snow-related) output variables written. This is the de- |
| | fault option. |
| 1 | All (including snow-related) output variables written. |
| 2 | Writes out a minimal set of output variables (use this to save space |
| | or if information about the different surfaces is not required). |

SuppressWarnings

Requirement Optional

Description Controls whether the warnings.txt file is written or not.

Configuration

| Value | Comments |
|-------|---|
| 0 | The warnings.txt file is written. This is the default option. |
| 1 | No warnings.txt file is written. May be useful for large model runs |
| | as this file can grow large. |

6.1.4 Options related to disaggregation of input data

DisaggMethod

Requirement Optional

Description Specifies how meteorological variables in the input file (except rain and snow) are disaggregated to the model time step. Wind direction is not currently downscaled so non -999 values will cause an error.

Configuration

| Value | Comments |
|-------|--|
| 1 | Linear downscaling of averages for all variables, additional zenith check is used for Kdown. This is the default option. |
| 2 | Linear downscaling of instantaneous values for all variables, additional zenith check is used for Kdown. |
| 3 | WFDEI setting: average Kdown (with additional zenith check); instantaneous for Tair, RH, pres and U. (N.B. WFDEI actually provides Q not RH) |

KdownZen

Requirement Optional

Description Can be used to switch off zenith checking in Kdown disaggregation. Note that the zenith calculation requires location information obtained from SUEWS_SiteSelect.txt. If a single met file is used for all grids, the zenith is calculated for the first grid and the disaggregated data is then applied for all grids.

Configuration

| Value | Comments |
|-------|--|
| 0 | No zenith angle check is applied. |
| 1 | Disaggregated Kdown is set to zero when zenith angle exceeds 90 degrees (i.e. sun below horizon) and redistributed over the day. This is the default option. |

RainDisaggMethod

Requirement Optional

Description Specifies how rain in the meteorological forcing file are disaggregated to the model time step. If present in the original met forcing file, snow is currently disaggregated in the same way as rainfall.

6.1. RunControl.nml

Configuration

| Value | Comments |
|-------|--|
| 100 | Rainfall is evenly distributed among all subintervals in a rainy interval. This is the default option. |
| 101 | Rainfall is evenly distributed among among RainAmongN subintervals in a rainy interval – also requires RainAmongN to be set. |
| 102 | Rainfall is evenly distributed among among RainAmongN subintervals in a rainy interval for different intensity bins – also requires MultRainAmongN and MultRainAmongNUpperI to be set. |

RainAmongN

Requirement Optional

Description Specifies the number of subintervals (of length tt) over which to distribute rainfall in each interval (of length TT). Must be an integer value. Use with RainDisaggMethod = 101.

Configuration to fill

MultRainAmongN

Requirement Optional

Description Specifies the number of subintervals (of length tt) over which to distribute rainfall in each interval (of length TT) for up to 5 intensity bins. Must take integer values. Use with RainDisaggMethod = 102. e.g. MultRainAmongN(1) = 5, MultRainAmongN(2) = 8, MultRainAmongN(3) = 12

Configuration to fill

MultRainAmongNUpperI

Requirement Optional

Description Specifies upper limit for each intensity bin to apply MultRainAmongN. Any intensities above the highest specified intensity will use the last MultRainAmongN value and write a warning to warnings.txt. Use with RainDisaggMethod = 102. e.g. MultRainAmongNUpperI(1) = 0.5, MultRainAmongNUpperI(2) = 2.0, MultRainAmongNUpperI(3) = 50.0

Configuration to fill

DisaggMethodESTM

Requirement Optional

Description Specifies how ESTM-related temperatures in the input file are disaggregated to the model time step.

Configuration

| Value | Comments |
|-------|---|
| 1 | Linear downscaling of averages. |
| 2 | Linear downscaling of instantaneous values. |

6.1.5 netCDF related options

ncMode

Requirement Optional

Description Determine if the output files should be written in netCDF format.

Configuration

| Value | Comments |
|-------|--|
| 0 | Output files are kept as plain text files (i.e., .txt). |
| 1 | Output files will be written in netCDF format (i.e., .nc). |

nRow

Requirement Optional

Description Number of rows (e.g., 36) in the output layout (only applicable when nc-Mode=1).

Configuration to fill

nCol

Requirement Optional

Description Number of columns (e.g., 47) in the output layout (only applicable when nc-Mode=1).

Configuration to fill

6.2 SUEWS_SiteInfo.xlsm

The following text files provide SUEWS with information about the study area.

6.2.1 SUEWS_AnthropogenicHeat.txt

SUEWS_AnthropogenicHeatFlux.txt provides the parameters needed to model the anthropogenic heat flux using either the method of Järvi et al. (2011) based on heating and cooling degree days (AnthropHeatMethod = 2 in $4.1 \ RunControl.nml$ (page 21)) or the method of Loridan et al. (2011) based on air temperature (AnthropHeatMethod = 1 in RunControl.nml (page 21)). The sub-daily variation in anthropogenic heat flux is modelled according to the daily cycles specified in SUEWS_Profiles.txt. Alternatively, if available, the anthropogenic heat flux can be provided in the met forcing file (and set AnthropHeatMethod = 0 in RunControl.nml (page 21)), in which case all columns here except Code and BaseTHDD should be set to '-999'.

| No. | Column Name | Use | Description |
|-----|--------------------|-----|--|
| 1 | Code (page 61) | L | Code linking to the AnthropogenicCode column in |
| | | | SUEWS_SiteSelect.txt . Value of integer is arbitrary but |
| | | | must match code specified in SUEWS_SiteSelect.txt. |
| 2 | BaseTHDD (page 60) | MU | Base temperature for heating degree days [°C] e.g. Sailor and |
| | | | Vasireddy (2006) [39] |
| 3 | $QF_A_Weekday$ | MU | Use with AnthropHeatChoice = 2 Example values [W m -2 (Cap |
| | (page 104) | 0 | ha-1) -1] 0.3081 Järvi et al. (2011) [1] 0.1 Järvi et al. (2014) [15] |
| 4 | $QF_B_Weekday$ | MU | Use with AnthropHeatMethod = 2 Example values [W m -2 K -1 |
| | (page 105) | 0 | (Cap ha -1) -1] 0.0099 Järvi et al. (2011) [1] 0.0099 Järvi et al. |
| | | | (2014) [15] |
| 5 | $QF_C_Weekday$ | MU | Use with AnthropHeatMethod = 2 Example values [W m -2 K -1 |
| | (page 105) | 0 | (Cap ha -1) -1] 0.0102 Järvi et al. (2011) [1] 0.0102 Järvi et al. |
| | | | (2014) [15] |
| 6 | $QF_A_Weekend$ | MU | Use with Anthrop HeatMethod = 2 Example values [W m -2 (Cap |
| | (page 105) | 0 | ha -1) -1] 0.3081 Järvi et al. (2011) [1] 0.1 Järvi et al. (2014) [15] |
| 7 | $QF_B_Weekend$ | MU | Use with AnthropHeatMethod = 2 Example values [W m -2 K -1 |
| | (page 105) | 0 | (Cap ha -1) -1] 0.0099 Järvi et al. (2011) [1] 0.0099 Järvi et al. |
| | | | (2014) [15] |
| 8 | $QF_C_Weekend$ | MU | Example values [W m -2 K -1 (Cap ha -1) -1] 0.0102 Järvi et al. |
| | (page 106) | 0 | (2011) [1] 0.0102 Järvi et al. (2014) [15] |
| 9 | AHMin (page 56) | MU | Use with $AnthropHeatMethod = 1$ |
| | | 0 | |
| 10 | AHSlope (page 57) | MU | Use with $AnthropHeatMethod = 1$ |
| | | 0 | |
| 11 | TCritic (page 118) | MU | Use with AnthropHeatMethod $= 1$ |
| | | 0 | |

6.2.2 SUEWS_Conductance.txt

SUEWS_Conductance.txt contains the parameters needed for the Jarvis (1976) surface conductance model used in the modelling of evaporation in SUEWS. These values should **not** be changed independently of each other. The suggested values below have been derived using datasets for Los Angeles and Vancouver (see Järvi et al. (2011) [J11] (page 183)) and should be used with gsModel=1 (page 83). An alternative formulation (gsModel=2 (page 83)) uses slightly different functional forms and different coefficients (with different units).

| No. | Column Name | Use | Description |
|-----|----------------------|-----|--|
| 1 | Code (page 61) | L | Code linking to the CondCode column in SUEWS_SiteSelect.txt |
| | | | . Value of integer is arbitrary but must match code specified in |
| | | | SUEWS_SiteSelect.txt. |
| 2 | G1 (page 79) | MD | Related to maximum surface conductance [mm s -1] |

6.2.3 SUEWS_Irrigation.txt

SUEWS includes a simple model for external water use if observed data are not available. The model calculates daily water use from the mean daily air temperature, number of days since rain and fraction of irrigated area using automatic/manual irrigation. The sub-daily pattern of water use is modelled according to the daily cycles specified in $SUEWS_Profiles.txt$ (page ??).

Alternatively, if available, the external water use can be provided in the met forcing file (and set WaterUseMethod = 1 in RunControl.nml (page ??)), in which case all columns here except Code should be set to '-999'.

| No. | Column Name | Use | Description |
|-----|------------------------|-----|--|
| 1 | Code (page 61) | L | Code linking to [[#SUEWS_SiteSelect.txt SUEWS_SiteSelect.txt] |
| | (1) | | for irrigation modelling (IrrigationCode). Value of integer is arbi- |
| | | | trary but must match codes specified in SUEWS_SiteSelect.txt. |
| 2 | Ie_start (page 85) | MU | Day when irrigation starts [DOY] |

6.2.4 SUEWS_NonVeg.txt

SUEWS_NonVeg.txt specifies the characteristics for the non-vegetated surface cover types (Paved, Bldgs, BSoil) by linking codes in column 1 of SUEWS_NonVeg.txt to the codes specified in SUEWS_SiteSelect.txt (Code_Paved, Code_Bldgs, Code_BSoil). Each row should correspond to a particular surface type. For suggestions on how to complete this table, see: Typical Values.

| No. | Column Name | Use | Description |
|------|----------------------------------|-----|---|
| 1 | Code (page 61) | L | Code linking to SUEWS_SiteSelect.txt for paved surfaces (Code_Paved), buildings (Code_Bldgs) and bare soil surfaces (Code_BSoil). Value of integer is arbitrary but must match codes specified in SUEWS_SiteSelect.txt. |
| 2 | AlbedoMin (page 57) | MU | Effective surface albedo (middle of the day value) for wintertime |
| | (1 3 / | | (not including snow). View factors should be taken into account. Not currently used for non-vegetated surfaces – set the same as AlbedoMax. |
| 3 | AlbedoMax (page 57) | MU | Effective surface albedo (middle of the day value) for summertime. View factors should be taken into account. |
| 4 | Emissivity (page 71) | MU | Effective surface emissivity. View factors should be taken into account. |
| 5 | StorageMin (page 113) | MD | Minimum water storage capacity for upper surfaces (i.e. canopy). Min/max values are to account for seasonal variation (e.g. leaf-on/leaf-off differences for vegetated surfaces). Not currently used for non-vegetated surfaces - set the same as StorageMax. Example values [mm] 0.48 Paved 0.25 Bldgs 0.8 BSoil |
| 6 | StorageMax (page 113) | MD | Maximum water storage capacity for upper surfaces (i.e. canopy) Min and max values are to account for seasonal variation (e.g. leafon/leaf-off differences for vegetated surfaces). Not currently used for non-vegetated surfaces - set the same as StorageMin. Example values [mm] 0.48 Paved 0.25 Bldgs 0.8 BSoil |
| 7 | WetThreshold (page 128) | MD | Depth of water which determines whether evaporation occurs from a partially wet or completely wet surface. Example values [mm] 0.6 Paved 0.6 Bldgs 1. BSoil |
| 8 | StateLimit (page 112) | MD | Currently only used for the water surface |
| 9 | DrainageEq (page 70) | MD | Options 1 Falk and Niemczynowicz (1978) [32] 2 Halldin et al. | | (page 99) | | tions in winter. Links to SUEWS_OHMCoefficients.txt . Value of |

6.2.5 SUEWS OHMCoefficients.txt

OHM, the Objective Hysteresis Model (Grimmond et al. 1991) [G91OHM] (page 183) calculates the storage heat flux as a function of net all-wave radiation and surface characteristics.

- For each surface, OHM requires three model coefficients (a1, a2, a3). The three should be selected as a set.
- The SUEWS_OHMCoefficients.txt file provides these coefficients for each surface type.
- A variety of values has been derived for different materials and can be found in the literature (see: [http://urban-climate.net/umep/TypicalValues#OHM_Coefficients| Typical Values]).
- Coefficients can be changed depending on:

:# surface wetness state (wet/dry) based on the calculated surface wetness state and soil moisture.

:# season (summer/winter) based on a 5-day running mean air temperature.

• To use the same coefficients irrespective of wet/dry and summer/winter conditions, use the same code for all four OHM columns (OHMCode_SummerWet, OHMCode_SummerDry, OHMCode_WinterWet and OHMCode_WinterDry).

Note, **AnOHM** does not use the coefficients specified in SUEWS_OHMCoefficients.txt but instead requires three parameters to be specified for each surface type (including snow): heat capacity, thermal conductivity and bulk transfer coefficient. These are specified in SUEWS_NonVeg.txt (page 36), SUEWS_Veg.txt (page 50), SUEWS_Water.txt (page 53) and SUEWS_Snow.txt (page 46). No additional files are required for AnOHM.

| 3 | a 2 (page 55) | MU | Coefficient for dQ*/dt term [h] | | |
| 4 | a3 (page 56) | MU | Constant term [W m -2] | | |

6.2.6 SUEWS_Profiles.txt

SUEWS_Profiles.txt specifies the daily cycle of variables related to human behaviour (energy use, water use and snow clearing). Different profiles can be specified for weekdays and weekends. The profiles are provided at hourly resolution here; the model will then interpolate the hourly energy and water use profiles to the resolution of the model time step and normalize the values provided. Thus it does not matter whether columns 2-25 add up to, say 1, 24, or another number, because the model will handle this. Currently, the snow clearing profiles are not interpolated as these are effectively a switch (0 or 1).

If the anthropogenic heat flux and water use are specified in the met forcing file, the energy and water use profiles are not used.

Profiles are specified for the following

- Anthropogenic heat flux (weekday and weekend)
- Water use (weekday and weekend; manual and automatic irrigation)

- Snow removal (weekday and weekend)
- Human activity (weekday and weekend).

Note: Human activity is not used in v2017a

| No. | Var | Use | Description |
|-----|----------------|-----|---|
| 1 | Code (page 61) | L | Code linking to SUEWS_SiteSelect.txt for snow surfaces (Snow- |
| | | | Code). Value of integer is arbitrary but must match code specified |
| | | | in SUEWS_SiteSelect.txt. |
| 2 | 2-25 | MU | Multiplier for each hour of the day [-] for energy and water use. |
| | | | For SnowClearing, set those hours to 1 when snow removal from |
| | | | paved and roof surface is allowed (0 otherwise) if the snow removal |
| | | | limits set in the SUEWS_Non Veg.txt (SnowLimR emove column) |
| | | | are exceeded. |

6.2.7 SUEWS_SiteSelect.txt

For each year and each grid, site specific surface cover information and other input parameters is provided to SUEWS by SUEWS_SiteSelect.txt (page 39). The model currently requires a new row for each year of the model run. All rows in this file (before the two rows of '-9') will be read by the model and run. In this file the column order is important. '!' can be used to indicate comments in the file. Comments are not read by the programme so they can be used by the user to provide notes for their interpretation of the contents. This is strongly recommended.

| No. | Column Name | Use | Description |
|-----|---------------------|-----|--|
| 1 | Grid (page 81) | MU | Grid numbers do not need to be consecutive and do not need to start |
| | | | at a particular value. Each grid must have a unique grid number. All |
| | | | grids must be present for all years. These grid numbers are referred |
| | | | to in GridConnections (columns 64-79) (N.B. GridConnections not |
| | | | currently implemented!) |
| 2 | Year (page 131) | MU | Year [YYYY] Years must be continuous. If running multiple years, |
| | | | ensure the rows in SiteSelect.txt are arranged so that all grids for |
| | | | a particular year appear on consecutive lines (rather than grouping |
| | | | all years together for a particular grid). |
| 3 | StartDLS (page 112) | MU | Start of the day light savings [DOY] See section on Day Light Sav- |
| | | | ings. |
| 4 | EndDLS (page 71) | MU | End of the day light savings [DOY] See section on Day Light Savings |
| | | | |
| 5 | lat (page 94) | MU | Use coordinate system WGS84. Positive values are northern hemi- |
| | | | sphere (negative southern hemisphere). Used in radiation calcu- |
| | | | lations. Note, if the total modelled area is small the latitude and |
| | | | longitude could be the same for each grid but small differences in ra- |
| | | | diation will not be determined. If you are defining the latitude and |
| | | | longitude differently between grids make certain that you provide |
| | | | enough decimal places. |

Table 6.1 – continued from previous page

| No. | Column Name | | Description |
|-----|---------------------------|-----|--|
| 32 | PopDensDay (page 102) | 0 | Daytime population density (i.e. workers, tourists) [people ha -1] |
| | | | Population density is required if AnthropHeatMethod = 2 in Run- |
| | | | Control.nml . The model will use the average of daytime and night- |
| | | | time population densities, unless only one is provided. If daytime |
| | | | population density is unknown, set to -999. |
| 33 | ${\it PopDensNight}$ | 0 | Night-time population density (i.e. residents) [people ha -1] Pop- |
| | (page 103) | | ulation density is required if AnthropHeatMethod = 2 in RunCon- |
| | | | trol.nml . The model will use the average of daytime and night-time |
| | | | population densities, unless only one is provided. If night-time population densities, unless only one is provided. |
| 9.4 | T CC: D | 0 | ulation density is unknown, set to -999. |
| 34 | TrafficRate | 0 | Traffic rate [veh km m-2 s-1] Can be used for CO2 flux calculation. Do not use in v2017a - set to -999 |
| 35 | (page 121) BuildEnergyUse | 0 | Building energy use [W m-2] Can be used for CO2 flux calculation. |
| 39 | (page 60) | | Do not use in v2017a - set to -999 |
| 36 | Code_Paved (page 65) | L | Code for Paved surface characteristics Provides the link to column |
| | | | 1 of SUEWS_NonVeg.txt, which contains the attributes describing |
| | | | paved areas in this grid for this year. Value of integer is arbitrary |
| | | | but must match code specified in column 1 of SUEWS_NonVeg.txt. |
| | | | e.g. 331 means use the characteristics specified in the row of input |
| 27 | Code Dideo (nomo 69) | T | file SUEWS_NonVeg.txt which has 331 in column 1 (Code). |
| 37 | Code_Bldgs (page 62) | L | Code for Bldgs surface characteristics Provides the link to column 1 of SUEWS_NonVeg.txt, which contains the attributes describing |
| | | | buildings in this grid for this year. Value of integer is arbitrary but |
| | | | must match code specified in column 1 of SUEWS_NonVeg.txt. |
| 38 | Code_EveTr (page 65) | L | Code for EveTr surface characteristics Provides the link to column |
| 00 | come_local, (page co) | | 1 of SUEWS_Veg.txt, which contains the attributes describing ev- |
| | | | ergreen trees and shrubs in this grid for this year. Value of in- |
| | | | teger is arbitrary but must match code specified in column 1 of |
| | | | SUEWS_Veg.txt. |
| 39 | Code_DecTr (page 63) | L | Code for DecTr surface characteristics Provides the link to column |
| | | | 1 of SUEWS_Veg.txt, which contains the attributes describing de- |
| | | | ciduous trees and shrubs in this grid for this year. Value of in- |
| | | | teger is arbitrary but must match code specified in column 1 of |
| 40 | Code Cmass (name 6E) | T | SUEWS_Veg.txt. Code for Grass surface characteristics Provides the link to column 1 |
| 40 | $Code_Grass (page 65)$ | L | of SUEWS_Veg.txt, which contains the attributes describing grass |
| | | | surfaces in this grid for this year. Value of integer is arbitrary but |
| | | | must match code specified in column 1 of SUEWS Veg.txt. |
| 41 | Code_Bsoil (page 63) | L | Code for BSoil surface characteristics Provides the link to column |
| | _ (1.0) | | 1 of SUEWS_NonVeg.txt, which contains the attributes describing |
| | | | bare soil in this grid for this year. Value of integer is arbitrary but |
| | | | must match code specified in column 1 of SUEWS_NonVeg.txt. |
| 42 | Code_Water (page 66) | L | Code for Water surface characteristics Provides the link to column |
| | | | 1 of SUEWS_Water.txt, which contains the attributes describing |
| | | | open water in this grid for this year. Value of integer is arbitrary |
| 40 | TIMPO D D ' | 1/0 | but must match code specified in column 1 of SUEWS_Water.txt. |
| 43 | LUMPS_DrRate | MD | Drainage rate of bucket for LUMPS [mm h -1] Used for LUMPS |
| | (page 96) | | surface wetness control. Default recommended value of 0.25 mm h -1 from Loridan et al. (2011) [5] . |
| | | | -1 Holli Loridali et al. (2011) [5] . |

Table 6.1 – continued from previous page

| No. | Column Name | | Description |
|-----|-----------------------------|----------|--|
| 44 | LUMPS_Cover (page 95) | MD | Limit when surface totally covered with water [mm] Used for |
| 11 | Loin b_oover (page 30) | ויו | LUMPS surface wetness control. Default recommended value of |
| | | | 1 mm from Loridan et al. (2011) [5]. |
| 45 | LUMPS_MaxRes | MD | Maximum water bucket reservoir [mm] Used for LUMPS surface |
| 40 | (page 96) | PID | wetness control. Default recommended value of 10 mm from Loridan |
| | (page 90) | | et al. (2011) [5]. |
| 46 | NARP_Trans (page 96) | MD | Atmospheric transmissivity for NARP [-] Value must in the range |
| 40 | WAIT_17 uns (page 50) | TID | 0-1. Default recommended value of 1. |
| 47 | CondCode (page 66) | L | Code for surface conductance parameters Provides the link to col- |
| 41 | contacoue (page 00) | | umn 1 of SUEWS Conductance.txt, which contains the parameters |
| | | | for the Jarvis (1976) parameterisation of surface conductance. Value |
| | | | of integer is arbitrary but must match code specified in column 1 |
| | | | of SUEWS_Conductance.txt. e.g. 33 means use the characteristics |
| | | | specified in the row of input file SUEWS_Conductance.txt which |
| | | | has 33 in column 1 (Code). |
| 48 | SnowCode (page 110) | L | Code for snow surface characteristics Provides the link to column |
| -0 | (rw80 110) | - | 1 of SUEWS Snow.txt, which contains the attributes describing |
| | | | snow surfaces in this grid for this year. Value of integer is arbitrary |
| | | | but must match code specified in column 1 of SUEWS_Snow.txt. |
| 49 | SnowClearingProfWD | L | Code for snow clearing profile (weekdays) Provides the link to col- |
| | (page 109) | | umn 1 of SUEWS_Profiles.txt. Value of integer is arbitrary but |
| | , | | must match code specified in column 1 of SUEWS_Profiles.txt. |
| | | | e.g. 1 means use the characteristics specified in the row of input |
| | | | file SUEWS_Profiles.txt which has 1 in column 1 (Code). |
| 50 | SnowClearingProfWE | L | Code for snow clearing profile (weekends) Provides the link to col- |
| | (page 109) | | umn 1 of SUEWS_Profiles.txt. Value of integer is arbitrary but |
| | | | must match code specified in column 1 of SUEWS_Profiles.txt. |
| | | | e.g. 1 means use the characteristics specified in the row of input file |
| | | | SUEWS_Profiles.txt which has 1 in column 1 (Code). Providing |
| | | | the same code for SnowClearingProfWD and SnowClearingProfWE |
| | | | would link to the same row in SUEWS_Profiles.txt, i.e. the same |
| | | | profile would be used for weekdays and weekends. |
| 51 | AnthropogenicCode | L | Code for modelling anthropogenic heat flux Provides the link to |
| | (page 59) | | column 1 of SUEWS_AnthropogenicHeat.txt, which contains the |
| | | | model coefficients for estimation of the anthropogenic heat flux |
| | | | (used if AnthropHeatChoice = 1, 2 in RunControl.nml). Value |
| | | | of integer is arbitrary but must match code specified in column 1 of |
| F0 | En an auti De SUD | <i>T</i> | SUEWS_AnthropogenicHeat.txt. |
| 52 | EnergyUseProfWD | L | Code for energy use profile (weekdays) Provides the link to column 1 |
| | (page 72) | | of SUEWS_Profiles.txt. Look the codes Value of integer is arbitrary |
| 59 | En amanilla a Des a filic | T | but must match code specified in column 1 of SUEWS_Profiles.txt. |
| 53 | EnergyUseProfWE | L | Code for energy use profile (weekends) Provides the link to column |
| | (page 72) | | 1 of SUEWS_Profiles.txt. Value of integer is arbitrary but must |
| 5.4 | A a t à a a tau Don a fl.ID | T | match code specified in column 1 of SUEWS_Profiles.txt. Code for human activity profile (weekdays) Provides the link to |
| 54 | ActivityProfWD (page 56) | L | column 1 of SUEWS Profiles.txt. Look the codes Value of in- |
| | (page 50) | | teger is arbitrary but must match code specified in column 1 of |
| | | | SUEWS_Profiles.txt. Used for CO2 flux calculation - not used in |
| | | | v2017a |
| | | | Continued on next page |

| | | | teger is arbitrary but must match code specified in column 1 of |
| | | | SUEWS_Profiles.txt. |
| 61 | FlowChange (page 74) | MD | Difference in input and output flows for water surface [mm h -1] |
| | | | Used to indicate river or stream flow through the grid. Currently |
| | | | not fully tested! |
| 62 | RunoffToWater | MD | Fraction of above-ground runoff flowing to water surface during |
| | (page 107) | MU | flooding [-] Value must be in the range 0-1. Fraction of above-ground |
| | | | runoff that can flow to the water surface in the case of flooding. |
| 63 | PipeCapacity | MD | Storage capacity of pipes [mm] Runoff amounting to less than the |
| | (page 102) | MU | value specified here is assumed to be removed by pipes. |
| 64 | GridConnection1of8 | MD | The next 8 pairs of columns specify the water flow between grids. |
| | (page 81) | MU | The first column of each pair specifies the grid that the water flows |
| | , | | to (from the current grid, column 1); the second column of each |
| | | | pair specifies the fraction of water that flow to that grid. The frac- |
| | | | tion (i.e. amount) of water transferred may be estimated based on |
| | | | elevation, the length of connecting surface between grids, presence |
| | | | of walls, etc. Water cannot flow from the current grid to the same |
| | | | grid, so the grid number here must be different to the grid number |
| | | | in column 1. Water can flow to a maximum of 8 other grids. If |
| | | | there is no water flow between grids, or a single grid is run, set to |
| | | | 0. See section on Grid Connections |
| 65 | Fraction1of8 | MD | Fraction of water that can flow to the grid specified in previous |
| | (page 74) | MU | column [-] |
| 66 | GridConnection2of8 | MD | Number of the grid where water can flow to |
| | (page 81) | MU | - |
| | · - / | | Continued on payt page |

see this one: a2 (page 55)

Day Light Savings (DLS)

The dates for DLS normally vary each year and country as they are often associated with a specific set of Sunday mornings at the beginning of summer and autumn. Note it is important to remember leap years. You can check http://www.timeanddate.com/time/dst/ for your city.

Tip: If DLS does not occur give a start and end day immediately after it. Make certain the dummy dates are correct for the hemisphere

for northern hemisphere, use: 180 181
for southern hemisphere, use: 365 1

Example when running multiple years (in this case 2008 and 2009 in Canada):

| Year | start of daylight savings | end of daylight savings |
|------|---------------------------|-------------------------|
| 2008 | 170 | 240 |
| 2009 | 172 | 242 |

Grid Connections (water flow between grids)

Caution:

- not currently implemented
- columns 64-79 of SUEWS_SiteSelect.txt (page 39) can be set to zero.

This section gives an example of water flow between grids, calculated based on the relative elevation of the grids and length of the connecting surface between adjacent grids. For the square grids in the figure, water flow is assumed to be zero between diagonally adjacent grids, as the length of connecting surface linking the grids is very small. Model grids need not be square or the same size.

The table gives example values for the grid connections part of *SUEWS_SiteSelect.txt* (page 39) for the grids shown in the figure. For each row, only water flowing out of the current grid is entered (e.g. water flows from 234 to 236 and 237, with a larger proportion of water flowing to 237 because of the greater length of connecting surface between 234 and 237 than between 234 and 236. No water is assumed to flow between 234 and 233 or 235 because there is no elevation difference between these grids. Grids 234 and 238 are at the same elevation and only connect at a point, so no water flows between them. Water enters grid 234 from grids 230, 231 and 232 as these are more elevated.

Note: Arrows indicate the water flow in to and out of grid 234, but note that only only water flowing out of each grid is entered in $SUEWS_SiteSelect.txt$ (page 39)

6.2.8 SUEWS_Snow.txt

SUEWS_Snow.txt specifies the characteristics for snow surfaces when *SnowUse=1* (page 23) in *RunControl.nml* (page 21). If the snow part of the model is not run, fill this table with '-999' except for the first (Code) column and set *SnowUse=0* (page 23) in *RunControl.nml* (page 21). For a detailed description of the variables, see Järvi et al. (2014) [Leena2014] (page 184).

Fig. 6.1: Example grid connections showing water flow between grids.

48

Warning: In the current release SnowUse (page 23) should be set to 0.

| No. | Column Name | Use | Description |
|-------------------|---|-----|---|
| 1 | Code (page 61) | L | Code linking to SUEWS_SiteSelect.txt for snow surfaces (Snow-Code). Value of integer is arbitrary but must match code specified in SUEWS_SiteSelect.txt. |
| 2 | ${\it RadMeltFactor}$ | MU | Hourly radiation melt factor of snow [mm W -1 h -1] |
| 2 | (page 107) | 110 | froutry radiation ment factor of show [min W -1 ii -1] |
| 3 | TempMeltFactor (page 118) | MU | Hourly temperature melt factor of snow [mm °C -1 h -1] (In previous model version, this parameter was 0.12) |
| 4 | AlbedoMin (page 57) | MU | Example values [-] 0.18 Järvi et al. (2014) [15] |
| 5 | AlbedoMax (page 57) | MU | Example values [-] 0.85 Järvi et al. (2014) [15] |
| 6 | Emissivity (page 71) | MU | Effective surface emissivity. View factors should be taken into account Example values [-] 0.99 Järvi et al. (2014) [15] |
| 7 | tau_a (page 117) | MD | Time constant for snow albedo aging in cold snow [-] |
| 8 | tau_f (page 117) | MD | Time constant for snow albedo aging in melting snow [-] |
| 9 | PrecipiLimAlb (page 103) | MD | Limit for hourly precipitation when the ground is fully covered with snow. Then snow albedo is reset to AlbedoMax [mm] |
| 10 | snowDensMin (page 110) | MD | Fresh snow density [kg m -3] |
| 11 | snowDensMax (page 110) | MD | Maximum snow density [kg m -3] |
| 12 | tau_r (page 118) | MD | Time constant for snow density ageing [-] |
| 13 | CRWMin (page 67) | MD | Minimum water holding capacity of snow [mm] |
| 14 | CRWMax (page 66) | MD | Maximum water holding capacity of snow [mm] |
| 15 | PrecipLimSnow (page 104) | MD | Auer (1974) [38] |
| 16 | OHMCode_SummerWet | L | Code for OHM coefficients to use for this surface during wet con- |
| | (page 98) | | ditions in summer. Links to SUEWS_OHMCoefficients.txt . Value |
| | | | of integer is arbitrary but must match code specified in column 1 of SUEWS_OHMCoefficients.txt. |
| 17 | OHMCode_SummerDry (page 97) | L | Code for OHM coefficients to use for this surface during dry conditions in summer. Links to SUEWS_OHMCoefficients.txt . Value of integer is arbitrary but must match code specified in column 1 of SUEWS_OHMCoefficients.txt. |
| 18 | OHMCode_WinterWet (page 99) | L | Code for OHM coefficients to use for this surface during wet conditions in winter. Links to SUEWS_OHMCoefficients.txt . Value of integer is arbitrary but must match code specified in column 1 of SUEWS_OHMCoefficients.txt. |
| 19 | OHMCode_WinterDry (page 99) | L | Code for OHM coefficients to use for this surface during dry conditions in winter. Links to SUEWS_OHMCoefficients.txt . Value of integer is arbitrary but must match code specified in column 1 of SUEWS_OHMCoefficients.txt. |
| 20 | OHMThresh_SW (page 100) | MD | Temperature threshold determining whether summer/winter OHM coefficients are applied [deg C] If 5-day running mean air temperature is greater than or equal to this threshold, OHM coefficients for summertime are applied; otherwise coefficients for wintertime are applied. Not actually used for Snow surface as winter wet conditions always assumed. |
| 21 | OHMThresh_WD (page 101) | MD | Soil moisture threshold determining whether wet/dry OHM coefficients are applied [-] If soil moisture (as a proportion of maximum soil moisture capacity) exceeds this threshold for bare soil and vegetated surfaces, OHM coefficients for wet conditions are applied; otherwise coefficients for dry coefficients are applied. Note that OHM coefficients for wet conditions are applied if the surface is wet. Not actually used for Snow surface as winter wet conditions |
| 5. <u>2</u> 22 | SUEWS_SiteInfo.xlsm ESTMCode (page 72) | L | always assumed. For paved and building surfaces, it is possible to specify multiple codes per grid (3 for paved, 5 for buildings) using |
| 00 | | | SUEWS_SiteSelect.txt . In this case, set ESTM code here to zero. |
| 23 | AnOHM Cn (page 58) | MIJ | Volumetric heat capacity for this surface to use in AnOHM [J m -3] |

6.2.9 SUEWS_Soil.txt

SUEWS_Soil.txt specifies the characteristics of the sub-surface soil below each of the non-water surface types (Paved, Bldgs, EveTr, DecTr, Grass, BSoil). The model does not have a soi store below the water surfaces. Note that these sub-surface soil stores are different to the bare soil/unmamnaged surface cover type. Each of the non-water surface types need to link to soil characteristics specified here. If the soil characteristics are assumed to be the same for all surface types, use a single code value to link the characteristics here with the SoilTypeCode columns in SUEWS_NonVeg.txt (page 36) and SUEWS_Veg.txt (page 50).

Soil moisture can either be provided using observational data in the met forcing file (smd_choice = 1 or 2 in *RunControl.nml* (page 21)) and providing some metadata information here (OBS columns), or modelled by SUEWS (smd_choice = 0 in *RunControl.nml* (page 21)). - Note, the option to use observational data is not operational in the current release!

| No. | Column Name | Use | Description |
|-----|--------------------------|-----|---|
| 1 | Code (page 61) | L | Code linking to the SoilTypeCode column in SUEWS_NonVeg.txt |
| | | | (for Paved, Bldgs and BSoil surfaces) and SUEWS_Veg.txt (for |
| | | | EveTr, DecTr and Grass surfaces). Value of integer is arbitrary but |
| | | | must match code specified in SUEWS_SiteSelect.txt. |
| 2 | SoilDepth (page 111) | MD | Depth of sub-surface soil store [mm] i.e. the depth of soil beneath |
| | | | the surface |
| 3 | SoilStoreCap | MD | SoilStoreCap must not be greater than SoilDepth. |
| | (page 111) | | |
| 4 | SatHydraulic Cond | MD | Hydraulic conductivity for saturated soil [mm s -1] |
| | (page 108) | | |
| 5 | SoilDensity | MD | Soil density [kg m -3] |
| | (page 111) | | |
| 6 | ${\it InfiltrationRate}$ | 0 | Not currently used |
| | (page 86) | | |
| 7 | $OBS_SMDepth (page 97)$ | 0 | Use only if soil moisture is observed and provided in the met forcing |
| | | | file and smd_choice = 1 or 2. Use of observed soil moisture not |
| | | | currently tested |
| 8 | OBS_SMCap (page 97) | 0 | Use only if soil moisture is observed and provided in the met forcing |
| | | | file and smd_choice = 1 or 2. Use of observed soil moisture not |
| | | | currently tested |
| 9 | $OBS_SoilNotRocks$ | 0 | Use only if soil moisture is observed and provided in the met forcing |
| | (page 97) | | file and smd_choice = 1 or 2. Use of observed soil moisture not |
| | | | currently tested |

6.2.10 SUEWS_Veg.txt

SUEWS_Veg.txt specifies the characteristics for the vegetated surface cover types (EveTr, DecTr, Grass) by linking codes in column 1 of SUEWS_Veg.txt to the codes specified in SUEWS_SiteSelect.txt (page ??) (Code_EveTr, Code_DecTr, Code_Grass). Each row should correspond to a particular surface type. For suggestions on how to complete this table, see: Typical Values.

| No. | Column Name | Use | Description |
|-----|----------------|-----|---|
| 1 | Code (page 61) | L | Code linking to SUEWS_SiteSelect.txt for evergreen trees and |
| | | | shrubs (Code_EveTr), deciduous trees and shrubs (Code_DecTr) and grass surfaces (Code_Grass). Value of integer is arbitrary but must match codes specified in SUEWS_SiteSelect.txt. |

Table 6.2 – continued from previous page

| No. | Column Name | | Description |
|-----|-----------------------|-----|--|
| 2 | AlbedoMin (page 57) | MU | Effective surface albedo (middle of the day value) for wintertime |
| | Atteuorin (page 51) | 110 | (not including snow), leaf-off. View factors should be taken into |
| | | | account. Example values [-] 0.1 EveTr Oke (1987) [35] 0.18 DecTr |
| | | | Oke (1987) [35] 0.21 Grass Oke (1987) [35] |
| 3 | AlbedoMax (page 57) | MU | Effective surface albedo (middle of the day value) for summertime, |
| 3 | Atteuomax (page 51) | 110 | full leaf-on. View factors should be taken into account. Example |
| | | | values [-] 0.1 EveTr Oke (1987) [35] 0.18 DecTr Oke (1987) [35] 0.21 |

| | (page do) | |

6.2.12 SUEWS_WithinGridWaterDist.txt

SUEWS_WithinGridWaterDist.txt specifies the movement of water between surfaces within a grid/area. It allows impervious connectivity to be taken into account.

Each row corresponds to a surface type (linked by the Code in column 1 to the SUEWS_SiteSelect.txt (page 39) columns: WithinGridPavedCode, WithinGridBldgsCode, ..., WithinGridWaterCode). Each column contains the fraction of water flowing from the surface type to each of the other surface types or to runoff or the sub-surface soil store.

Note:

- The sum of each row (excluding the Code) must equal 1.
- Water cannot flow from one surface to that same surface, so the diagonal elements should be zero.
- The row corresponding to the water surface should be zero, as there is currently no flow permitted from the water surface to other surfaces by the model.
- Currently water **cannot** go to both runoff and soil store (i.e. it must go to one or the other runoff for impervious surfaces; soilstore for pervious surfaces).

In the table below, for example,

- all flow from paved surfaces goes to runoff;
- 90% of flow from buildings goes to runoff, with small amounts going to other surfaces (mostly paved surfaces as buildings are often surrounded by paved areas);
- all flow from vegetated and bare soil areas goes into the sub-surface soil store;
- the row corresponding to water contains zeros (as it is currently not used).

| No. | Column Name | Use | Description |
|-----|------------------------|-----|---|
| 1 | ToPaved (page 120) | MU | Fraction of water going to Paved |
| 2 | ToBldgs (page 119) | MU | Fraction of water going to Bldgs |
| 3 | ToEveTr (page 120) | MU | Fraction of water going to EveTr |
| 4 | ToDecTr (page 120) | MU | Fraction of water going to DecTr |
| 5 | ToGrass (page 120) | MU | Fraction of water going to <i>Grass</i> |
| 6 | ToBSoil (page 120) | MU | Fraction of water going to BSoil |
| 7 | ToWater (page 121) | MU | Fraction of water going to Water |
| 8 | ToRunoff (page 121) | MU | Fraction of water going to Runoff |
| 9 | ToSoilStore (page 121) | MU | Fraction of water going to SoilStore |

| | | to in GridConnections (columns 64-79) (N.B. GridConnections not |
| | | currently implemented!) |

GridConnection1of8

Description The next 8 pairs of columns specify the water flow between grids. The first column of each pair specifies the grid that the water flows to (from the current grid, column 1); the second column of each pair specifies the fraction of water that flow to that grid. The fraction (i.e. amount) of water transferred may be estimated based on elevation, the length of connecting surface between grids, presence of walls, etc. Water cannot flow from the current grid to the same grid, so the grid number here must be different to the grid number in column 1. Water can flow to a maximum of 8 other grids. If there is no water flow between grids, or a single grid is run, set to 0. See section on Grid Connections

StateLimit

Description Currently only used for the water surface Currently only used for the water surface Surface state cannot exceed this value. Set to a large value (e.g. 20000 mm = 20 m) if the water body is substantial (lake, river, etc) or a small value (e.g. 10 mm) if water bodies are very shallow (e.g. fountains). WaterDepth (column 9) must not exceed this value.

These text files are stored as worksheets in **SUEWS_SiteInfo.xlsm** and can be either edited using Excel and then generated using the macro, or edited directly (see *Data Entry* (page ??)). Please note this file is subject to possible changes from version to version due to new features, modifications, etc. Please be aware of using the correct copy of this worksheet that are always shipped with the SUEWS public release.

| Use | Column |
|-----|---|
| MU | Parameters which must be supplied and must be specific for the site/grid being run. |
| MD | Parameters which must be supplied and must be specific for the site/grid being run (but default |
| | values may be ok if these values are not known specifically for the site). |
| О | Parameters that are optional, depending on the model settings in RunControl. Set any parameters |
| | that are not used/not known to '-999'. |
| L | Codes that are used to link between the input files. These codes are required but their values |
| | are completely arbitrary, providing that they link the input files in the correct way. The user |
| | should choose these codes, bearing in mind that the codes they match up with in column 1 of the |
| | corresponding input file must be unique within that file. Codes must be integers. Note that the |
| | codes must match up with column 1 of the corresponding input file, even if those parameters are |
| | not used (in which case set all columns except column 1 to '-999' in the corresponding input file), |
| | otherwise the model run will fail. |

6.3 Initial Conditions file

To start the model, information about the conditions at the start of the run is required. This information is provided in initial conditions file. One file can be specified for each grid (MultipleInitFiles=1 (page 29) in RunControl.nml (page 21), filename includes grid number) or, alternatively, a single file can be specified for all grids (MultipleInitFiles=0 in RunControl.nml (page 21), no grid number in the filename). After that, a new InitialConditionsSSss_YYYY.nml file will be written for each grid for the following years. It is recommended that you look at these files (written to the input directory) to check the status of various surfaces at the end or the run. This may help you get more realistic starting values if you are uncertain what they should be. Note this file will be created for each year for multiyear runs for each grid. If the run finishes before the end of the year the InitialConditions file is still written and the file name is appended with '_EndofRun'.

A sample file of InitialConditionsSSss_YYYY.nml looks like

```
&InitialConditions
LeavesOutInitially=0
SoilstorePavedState=150
SoilstoreBldgsState=150
SoilstoreEveTrstate=150
SoilstoreDecTrState=150
SoilstoreGrassState=150
SoilstoreBSoilState=150
BoInit=10
//
```

The two most important pieces of information in the initial conditions file is the soil moisture and state of vegetation at the start of the run. This is the minimal information required; other information can be provided if known, otherwise SUEWS will make an estimate of initial conditions.

The parameters and their setting instructions are provided through the links below:

Note: Variables can be in any order

• Soil moisture states (page 134)

6.3.1 Soil moisture states

SoilstorePavedState

Requirement Required

Description For maximum values, see the used soil code in SUEWS Soil.txt

Configuration to fill

SoilstoreBldgsState

Requirement Required

Description For maximum values, see the used soil code in SUEWS Soil.txt

Configuration to fill

SoilstoreEveTrState

Requirement Required

Description For maximum values, see the used soil code in SUEWS Soil.txt

Configuration to fill

SoilstoreDecTrState

Requirement Required

Description For maximum values, see the used soil code in SUEWS Soil.txt

Configuration to fill

SoilstoreGrassState

Requirement Required

Description For maximum values, see the used soil code in SUEWS Soil.txt

Configuration to fill

SoilstoreBSoilState

Requirement Required

Description For maximum values, see the used soil code in SUEWS_Soil.txt

Configuration to fill

6.3.2 Vegetation parameters

LeavesOutIntially

Requirement Optional

Description If the model run starts in winter when trees are bare, set LeavesOutIntially = 0 and the vegetation parameters will be set accordingly based on the values set in SUEWS_SiteInfo.xlsm. If the model run starts in summer when leaves are fully out, set LeavesOutIntially = 1 and the vegetation parameters will be set accordingly based on the values set in SUEWS_SiteInfo.xlsm. Not LeavesOutInitially can only be set to 0, 1 or -999 (fractional values cannot be used to indicate partial leaf-out). The value of LeavesOutInitially overrides any values provided for the individual vegetation parameters. To prevent LeavesOutInitially from setting the initial conditions, either omit it from the namelist or set to -999. If values are provided individually, they should be consistent the information provided in SUEWS_Veg.txt and the time of year. If values are provided individually, values for all required surfaces must be provided (i.e. specifying only albGrass0 but not albDecTr0 nor albEveTr0 is not permitted).

Configuration to fill

GDD_1_0

Requirement Optional

Description Cannot be negative. If leaves are already full, then this should be the same as GDDFull in SUEWS_Veg.txt. If winter, set to 0. It is important that the vegetation characteristics are set correctly (i.e. for the start of the run in summer/winter).

Configuration to fill

GDD_2_0

Requirement Optional

Description Cannot be positive If the leaves are full but in early/mid summer then set to 0. If late summer or autumn, this should be a negative value. If leaves are off, then use the values of SDDFull in SUEWS_Veg.txt to guide your minimum value. It is important that the vegetation characteristics are set correctly (i.e. for the start of the run in summer/winter).

Configuration to fill

${\tt LAIinitialEveTr}$

Requirement Optional

Description Initial LAI for evergreen trees. The recommended values can be found from SUEWS_Veg.txt

Configuration to fill

LAIinitialDecTr

Requirement Optional

Description Initial LAI for deciduous trees. The recommended values can be found from SUEWS Veg.txt

Configuration to fill

LAIinitialGrass

Requirement Optional

Description Initial LAI for irrigated grass. The recommended values can be found from SUEWS Veg.txt

Configuration to fill

albEveTr0

Requirement Optional

Description Albedo of evergreen surface on day 0 of run

Configuration to fill

albDecTr0

Requirement Optional

Description Albedo of deciduous surface on day 0 of run

Configuration to fill

albGrass0

Requirement Optional

Description Albedo of grass surface on day 0 of run

Configuration to fill

decidCap0

Requirement Optional

Description Deciduous storage capacity on day 0 of run.

Configuration to fill

porosity0

Requirement Optional

Description Porosity of deciduous vegetation on day 0 of run. This varies between 0.2 (leaf-on) and 0.6 (leaf-off).

Configuration to fill

6.3.3 Recent meteorology

DaysSinceRain

Requirement Optional

Description Important to use correct value if starting in summer season If starting when external water use is not occurring it will be reset with the first rain so can just be set to 0. If unknown, SUEWS sets to zero by default. Used to model irrigation.

Configuration to fill

Temp_C0

Requirement Optional

Description If unknown, SUEWS uses the mean temperature for the first day of the run.

Configuration to fill

6.3.4 Above Ground State

PavedState

Requirement Optional

Description If unknown, model assumes dry surfaces (acceptable as rainfall or irrigation will update these states quickly).

Configuration to fill

BldgsState

Requirement Optional

Description If unknown, model assumes dry surfaces (acceptable as rainfall or irrigation will update these states quickly).

Configuration to fill

EveTrState

Requirement Optional

Description If unknown, model assumes dry surfaces (acceptable as rainfall or irrigation will update these states quickly).

Configuration to fill

DecTrState

Requirement Optional

Description If unknown, model assumes dry surfaces (acceptable as rainfall or irrigation will update these states quickly).

Configuration to fill

GrassState

Requirement Optional

Description If unknown, model assumes dry surfaces (acceptable as rainfall or irrigation will update these states quickly).

Configuration to fill

BSoilState

Requirement Optional

Description If unknown, model assumes dry surfaces (acceptable as rainfall or irrigation will update these states quickly).

Configuration to fill

WaterState

Requirement Optional

Description For a large water body (e.g. river, sea, lake) set WaterState to a large value, e.g. 20000 mm; for small water bodies (e.g. ponds, fountains) set WaterState to smaller value, e.g. 1000 mm. This value must not exceed StateLimit specified in SUEWS_Water.txt . If unknown, model uses value of WaterDepth specified in SUEWS_Water.txt .

Configuration to fill

6.3.5 Snow related parameters

SnowIntially

Requirement Optional

Description If the model run starts when there is no snow on the ground, set SnowIntially = 0 and the snow-related parameters will be set accordingly. If the model run starts when there is snow on the ground, the following snow-related parameters must be set appropriately. The value of SnowInitially overrides any values provided for the individual snow-related parameters. To prevent SnowInitially from setting the initial conditions, either omit it from the namelist or set to -999. If values are provided individually, they should be consistent the information provided in SUEWS Snow.txt .

Configuration to fill

SnowWaterPavedState

Requirement Optional

Description Initial amount of liquid water in the snow on paved surfaces.

Configuration to fill

SnowWaterBldgsState

Requirement Optional

Description Initial amount of liquid water in the snow on buildings

Configuration to fill

SnowWaterEveTrState

Requirement Optional

Description Initial amount of liquid water in the snow on evergreen trees

Configuration to fill

SnowWaterDecTrState

Requirement Optional

Description Initial amount of liquid water in the snow on deciduous trees

Configuration to fill

SnowWaterGrassState

Requirement Optional

Description Initial amount of liquid water in the snow on grass surfaces

Configuration to fill

SnowWaterBSoilState

Requirement Optional

Description Initial amount of liquid water in the snow on bare soil surfaces

Configuration to fill

SnowWaterWaterState

Requirement Optional

Description Initial amount of liquid water in the snow in water

Configuration to fill

SnowPackPaved

Requirement Optional

Description Initial snow water equivalent if the snow on paved surfaces

Configuration to fill

SnowPackBldgs

Requirement Optional

Description Initial snow water equivalent if the snow on buildings

Configuration to fill

SnowPackEveTr

Requirement Optional

Description Initial snow water equivalent if the snow on evergreen trees

Configuration to fill

SnowPackDecTr

Requirement Optional

Description Initial snow water equivalent if the snow on deciduous trees

Configuration to fill

SnowPackGrass

Requirement Optional

Description Initial snow water equivalent if the snow on grass surfaces

Configuration to fill

SnowPackBSoil

Requirement Optional

Description Initial snow water equivalent if the snow on bare soil surfaces

Configuration to fill

SnowPackWater

Requirement Optional

Description Initial snow water equivalent if the snow on water

Configuration to fill

SnowFracPaved

Requirement Optional

Description Initial plan area fraction of snow on paved surfaces

Configuration to fill

${\tt SnowFracBldgs}$

Requirement Optional

Description Initial plan area fraction of snow on buildings

Configuration to fill

SnowFracEveTr

Requirement Optional

Description Initial plan area fraction of snow on evergreen trees

Configuration to fill

SnowFracDecTr

Requirement Optional

Description Initial plan area fraction of snow on deciduous trees

Configuration to fill

SnowFracGras

Requirement Optional

Description Initial plan area fraction of snow on grass surfaces

Configuration to fill

SnowFracBSoil

Requirement Optional

Description Initial plan area fraction of snow on bare soil surfaces

Configuration to fill

SnowFracWater

Requirement Optional

Description Initial plan area fraction of snow on water

Configuration to fill

SnowDensPaved

Requirement Optional

Description Initial snow density on paved surfaces

Configuration to fill

SnowDensBldgs

Requirement Optional

Description Initial snow density on buildings

Configuration to fill

${\tt SnowDensEveTr}$

Requirement Optional

Description Initial snow density on evergreen trees

Configuration to fill

SnowDensDecTr

Requirement Optional

Description Initial snow density on deciduous trees

Configuration to fill

${\tt SnowDensGrass}$

Requirement Optional

Description Initial snow density on grass surfaces

Configuration to fill

SnowDensBSoil

Requirement Optional

Description Initial snow density on bare soil surfaces

Configuration to fill

SnowDensWater

Requirement Optional

Description Initial snow density on water

Configuration to fill

6.4 Meteorological Input File

SUEWS is designed to run using commonly measured meteorological variables.

- Required inputs must be continuous i.e. **gap fill** any missing data.
- The table below gives the required (R) and optional (O) additional input variables.
- If an optional input variable is not available or will not be used by the model, enter '-999.0' for this column.
- Since v2017a forcing files no longer need to end with two rows containing '-9' in the first column.
- One single meteorological file can be used for all grids (MultipleMetFiles=0 in RunControl.nml (page ??), no grid number in file name) if appropriate for the study area, or
- separate met files can be used for each grid if data are available (MultipleMetFiles=1 in RunControl.nml (page ??), filename includes grid number).
- The meteorological forcing file names should be appended with the temporal resolution in minutes (SS_YYYY_data_tt.txt, or SSss_YYYY_data_tt.txt for multiple grids).
- Separate met forcing files should be provided for each year.
- Files do not need to start/end at the start/end of the year, but they must contain a whole number of days.
- The meteorological input file should match the information given in SUEWS_SiteSelect.txt (page ??).
- If a partial year is used that specific year must be given in SUEWS_SiteSelect.txt.
- If multiple years are used, all years should be included in SUEWS SiteSelect.txt.
- If a whole year (e.g. 2011) is intended to be modelled using and hourly resolution dataset, the number of lines in the met data file should be 8760 and begin and end with:

```
iy id it imin
2011 1 1 0 ...
...
2012 1 0 0 ...
```

6.4.1 SSss_YYYY_data_tt.txt

Main meteorological data file.

| No. | Use | Column | Description |
|-----|-----|--------|--|
| | | name | |
| 1 | R | iy | Year [YYYY] |
| 2 | R | id | Day of year [DOY] |
| 3 | R | it | Hour [H] |
| 4 | R | imin | Minute [M] |
| 5 | О | qn | Net all-wave radiation [W m $^-$ 2] - Required if NetRad iationMetho d = 1. |
| 6 | О | qh | Sensible heat flux [W m^-2] |
| 7 | О | qe | Latent heat flux [W m^-2] |
| 8 | О | qs | Storage heat flux [W m^-2] |
| 9 | О | qf | Anthropogen ic heat flux [W m^-2] |
| 10 | R | U | Wind speed [m s^-1] *Height of the wind speed measurement (z) is needed in |
| | | | [[#SUEWS_Si teSelect.tx t] |
| 11 | R | RH | Relative Humidity [%] |
| 12 | R | Tair | Air temperature [°C] |
| 13 | R | pres | Barometric pressure [kPa] |
| 14 | R | rain | Rainfall [mm] |
| 15 | R | kdown | Incoming shortwave radiation [W m $^-$ 2] - Must be > 0 W m $^-$ 2. |
| 16 | О | snow | Snow [mm] - Required if SnowUs $e = 1$ |
| 17 | О | ldown | Incoming longwave radiation [W m^-2] |
| 18 | О | fcld | Cloud fraction [tenths] |
| 19 | О | Wuh | External water use [m^-3] |
| 20 | О | xsmd | Observed soil moisture [m^-3 m^-3] or [kg kg^-1] |
| 21 | О | lai | Observed leaf area index [m^-2 m^-2] |
| 22 | О | kdiff | Diffuse radiation [W m $^-$ -2] - Recommended if SOLWEIGUse = 1 |
| 23 | О | kdir | Direct radiation [W m $^-$ 2] - Recommended if SOLWEIGUse = 1 |
| 24 | О | wdir | Wind direction [°] - Currently not implemented |

6.5 CBL input files

Main references for this part of the model: Onomura et al. (2015) [Shiho2015] (page 184) and Cleugh and Grimmond (2001) [CG2001] (page 184).

If CBL slab model is used (CBLuse = 1 (page 23) in RunControl.nml (page 21)) the following files are needed.

| Filename | Purpose |
|---------------------------------|--|
| CBL_initial_data.txt (page 143) | Gives initial data every morning * when CBL slab model starts running. * filename must match the InitialData FileName in CBLInput.nml * fixed for- |
| | mats. |
| CBLInput.nml (page 144) | Specifies run options, parameters and input file names. * Can be in any order |

6.5.1 CBL_initial_data.txt

This file should give initial data every morning when CBL slab model starts running. The file name should match the InitialData_FileName in CBLInput.nml.

Definitions and example file of initial values prepared for Sacramento.

6.5. CBL input files

| No. | Column name | Description |
|-----|-------------|---|
| 1 | id | Day of year [DOY] |
| 2 | zi0 | initial convective boundary layer |
| | | height (m) |
| 3 | gamt_Km | vertical gradient of potential |
| | | temperature (K m ⁻¹) strength of |
| | | the inversion |
| 4 | gamq_gkgm | vertical gradient of specific hu- |
| | | midity (g kg^{-1} m^{-1}) |
| 5 | Theta+_K | potential temperature at the top |
| | | of CBL (K) |
| 6 | q+_gkg | specific humidity at the top of |
| | | CBL (g kg ⁻¹) |
| 7 | Theta_K | potential temperature in CBL |
| | | (K) |
| 8 | q_gkg | specific humidiy in CBL (g kg ⁻¹) |

• gamt_Km and gamq_gkgm written to two significant figures are required for the model performance in appropriate ranges [Shiho2015] (page 184).

| id | zi0 | gamt_Km | gamq_gkgm | Theta + K | q+_gkg | theta_K | q_gkg |
|-----|-----|---------|-----------|-----------|--------|---------|-------|
| 234 | 188 | 0.0032 | 0.00082 | 290.4 | 9.6 | 288.7 | 8.3 |
| 235 | 197 | 0.0089 | 0.089 | 290.2 | 8.4 | 288.3 | 8.7 |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |

6.5.2 CBLInput.nml

sample file of CBLInput.nml looks like

```

```

Note: The file contents can be in any order.

The parameters and their setting instructions are provided through the links below (page 145):

- EntrainmentType (page 145)
- *QH_Choice* (page 145)
- InitialData_use (page 145)
- Sondeflag (page 146)
- CBLday(id) (page 146)
- CO2_included (page 146)
- FileSonde(id) (page 146)
- InitialDataFileName (page 146)
- *Wsb* (page 146)

CBLinput

EntrainmentType

Requirement Required

Description Determines entrainment scheme. See Cleugh and Grimmond 2000 [16] for details.

Configuration

| Value | Comments | | |
|-------|---|--|--|
| 1 | Tennekes and Driedonks (1981) - Recommended | | |
| 2 | McNaughton and Springs (1986) | | |
| 3 | Rayner and Watson (1991) | | |
| 4 | Tennekes (1973) | | |

QH_Choice

Requirement Required

Description Determines QH used for CBL model.

Configuration

| Value | Comments |
|-------|--|
| 1 | QH modelled by SUEWS |
| 2 | QH modelled by LUMPS |
| 3 | Observed QH values are used from the meteorological input file |

InitialData_use

Requirement Required

Description Determines initial values (see CBL_Initial_data.txt)

Configuration

| Value | Comments | | | | | | |
|-------|--|--|--|--|--|--|--|
| 0 | All initial values are calculated. (Not available in current release.) | | | | | | |
| 1 | Take zi0, gamt_Km and gamq_gkgm from input data file. | | | | | | |
| | Theta+_K, q+_gkg, Theta_K and q_gkg are calculated using | | | | | | |
| | Temp_C, avrh and Pres_kPa in meteorological input file. | | | | | | |
| 2 | Take all initial values from input data file (see | | | | | | |
| | CBL_Initial_data.txt). | | | | | | |

Sondeflag

Requirement Required

Description to fill

Configuration

| Value | Comments |
|-------|--|
| 0 | Does not read radiosonde vertical profile data - recommended |
| 1 | Reads radiosonde vertical profile data |

CBLday(id)

Requirement Required

Description Set CBLday(id) = 1 If CBL model is set to run for DOY 175–177, CBLday(175) = 1, CBLday(176) = 1, CBLday(177) = 1

Configuration to fill

CO2_included

Requirement Required

Description Set to zero in current version

Configuration to fill

FileSonde(id)

Requirement Required

Description If Sondeflag=1, write the file name including the path from site directory e.g. FileSonde(id)= 'CBLinputfilesXXX.txt', XXX is an arbitrary name.

Configuration to fill

InitialDataFileName

Requirement Required

Description If InitialData_use 1, write the file name including the path from site directory e.g. InitialDataFileName='CBLinputfilesCBL_initial_data.txt'

Configuration to fill

Wsb

Requirement Required

Description Subsidence velocity (m s -1) in eq. 1 and 2 of Onomura et al. (2015) [17] . (-0.01 m s -1 recommended)

Configuration to fill

6.6 ESTM-related files

6.6.1 SUEWS_ESTMCoefficients.txt

Note ESTM is under development in v2017a and should not be used!

The Element Surface Temperature Method (ESTM) (Offerle et al., 2005) calculates the net storage heat flux from surface temperatures. In the method the three-dimensional urban volume is reduced to four 1-d elements (i.e. building roofs, walls, and internal mass and ground (road, vegetation, etc)). The storage heat flux is calculated from the heat conduction through the different elements. For the inside surfaces of the roof and walls, and both surfaces for the internal mass (ceilings/floors, internal walls), the surface temperature of the element is determined by setting the conductive heat transfer out of (in to) the surface equal to the radiative and convective heat losses (gains). Each element (roof, wall, internal element and ground) can have maximum five layers and each layer has three parameters tied to it: thickness (x), thermal conductivity (k), volumetric heat capacity (rhoCp).

If ESTM is used (QSchoice=4), the files $SUEWS_ESTMCoefficients.txt$ (page 147), ESTMinput.nml and $SSss_YYYY_ESTM_Ts_data_tt.txt$ (page 149) should be prepared.

SUEWS_ESTMCoefficients.txt contains the parameters for the layers of each of the elements (roofs, wall, ground, internal mass).

- If less than five layers are used, the parameters for unused layers should be set to -999.
- The ESTM coefficients with the prefix *Surf_* must be specified for each surface type (plus snow) but the *Wall_* and *Internal_* variables apply to the building surfaces only.
- For each grid, one set of ESTM coefficients must be specified for each surface type; for paved and building surfaces it is possible to specify up to three and five sets of coefficients per grid (e.g. to represent different building materials) using the relevant columns in SUEWS_SiteSelect.txt (page 39). For the model to use these columns in site select, the ESTMCode column in SUEWS_NonVeg.txt (page 36) should be set to zero.

Note ESTM is under development in v2017a and should not be used!

The following input files are required if ESTM is used to calculate the storage heat flux.

6.6.2 ESTMinput.nml

ESTMinput.nml specifies the model settings and default values.

A sample file of **ESTMinput.nml** looks like

Note: The file contents can be in any order.

The parameters and their setting instructions are provided through the links below (page 148):

- TsurfChoice (page 148)
- evolveTibld (page 148)
- IbldCHmod (page 148)
- *LBC_soil* (page 148)
- *Theat_fix* (page 149)
- Theat_off (page 149)
- *Theat_on* (page 149)

ESTMinput

TsurfChoice

Requirement Required

Description Source of surface temperature data used.

Configuration

| Value | Comments |
|-------|--|
| 0 | *Tsurf in SSss_YYYY_ESTM_Ts_data_tt.txt used for all surface elements. |
| 1 | Input surface temperature are different for ground, roof and wall. |
| 2 | Wall surface temperature is different for four directions. |

evolveTibld

Requirement Required

Description Source of internal building temperature (Tibld)

Configuration

| Value | Comments |
|-------|--|
| 0 | *Tiair in SSss_YYYY_ESTM_Ts_data_tt.txt used. |
| 1 | *Tibld calculated considering the effect of anthropogenic heat from HVAC |
| 2 | *Tibld calculated without considering the influence of HVAC. |

IbldCHmod

Requirement Required

Description Method to calculate internal convective heat exchange coefficients (CH) for internal building, wall and roof if evolveTibld is 1 or 2.

Configuration

| Value | Comments |
|-------|---|
| 0 | CHs are read from SUEWS_ESTMcoefficients.txt. |
| 1 | CHs are calculated based on ASHRAE (2001) |
| 2 | CHs are calculated based on Awbi (1998). |

LBC_soil

Requirement Required

Description Soil temperature at lowest boundary condition [° C]

Configuration to fill

Theat_fix

Requirement Required

Description Ideal internal building temperature [° C]

Configuration to fill

Theat_off

Requirement Required

Description Temperature at which heat control is turned off (used when evolveTibld=1) $[^{\circ}C]$

Configuration to fill

Theat_on

Requirement Required

Description Temperature at which heat control is turned on (used when evolveTibld =1) $[\ ^{\circ} C]$

Configuration to fill

6.6.3 SSss_YYYY_ESTM_Ts_data_tt.txt

 $SSss_YYYY_ESTM_Ts_data_tt.txt$ (page 149) contains a time-series of input surface temperature for roof, wall, ground and internal elements.

| No. | Column Name | Use | Description |
|-----|---------------------|-----|---|
| 1 | <i>iy</i> (page 92) | MU | Year [YYYY] |
| 2 | id (page 84) | MU | Day of year [DOY] |
| 3 | <i>it</i> (page 91) | MU | Hour [H] |
| 4 | imin (page 86) | MU | Minute [M] |
| 5 | Tiair (page 119) | MU | Indoor air temperature [° C] |
| 6 | Tsurf (page 122) | MU | Bulk surface temperature [° C] (used when TsurfCoice = 0) |
| 7 | Troof (page 122) | MU | Roof surface temperature [° C] (used when TsurfChoice = 1 or 2) |
| 8 | Troad (page 121) | MU | Ground surface temperature [° C] (used when TsurfChoice = 1 or 2) |
| 9 | Twall (page 122) | MU | Wall surface temperature [° C] (used when TsurfChoice = 1) |
| 10 | $Twall_n$ | MU | North-facing wall surface temperature [° C] (used when TsurfChoice = |
| | (page 122) | | 2) |
| 11 | Twall_e | MU | East-facing wall surface temperature [° C] (used when TsurfChoice = |
| | (page 122) | | 2) |
| 12 | Twall_s | MU | South-facing wall surface temperature [° C] (used when TsurfChoice = |
| | (page 123) | | 2) |
| 13 | $Twall_w$ | MU | West-facing wall surface temperature [° C] (used when TsurfChoice = |
| | (page 123) | | 2) |

6.7 SOLWEIG input files

If the SOLWEIG model option is used (SOLWEIGout=1), spatial data and a SOLWEIGInput.nml file need to be prepared. The Digital Surface Models (DSMs) as well as derivatives originating from DSMs, e.g. Sky View Factors (SVF) must have the same spatial resolution and extent. Since SOLWEIG is a 2D model it will considerably increase computation time and should be used with care.

Description of choices in SOLWEIGinput_file.nml file. The file can be in any order.

```
• SOLWEIGinput (page 150)
    - Posture (page 150)
    - usevegdem (page 150)
    - onlyglobal (page 151)
    - SOLWEIGpoi_out (page 151)
    - Tmrt_out (page 151)
    - Lup2d_out (page 151)
    - Ldown2d_out (page 152)

Requirement Required

Description Ground and Building DSM

Configuration to fill

DSMPath

Requirement Required

Description Path to Digital Surface Models (DSM).

Configuration to fill

heightgravity

Requirement Required

Description Recommended value for a standing man: 1.1 m

Configuration to fill

OutInterval

Requirement Required

Description Output interval. Set to 60 in current version.

Configuration to fill

row

Requirement Required

Description X coordinate for point of interest. Here all variables from the model will written to SOLWEIGpoiOUT.txt

Configuration to fill

SVFPath

Requirement Required

Description Path to SVFs matrices (See Lindberg and Grimmond (2011) [19] for details)

Configuration to fill

SVFSuffix

Requirement Required

Description Suffix used (if any)

Configuration to fill

TDSMname

Requirement Required

Description Vegetation trunk zone DSM

Configuration to fill

TransMax

Requirement Required

Description Recommended value: 0.50 (Konarska et al. 2014 [40])

Configuration to fill

TransMin

 ${\bf Requirement} \ \ {\rm Required}$

Description Recommended value: 0.02 (Konarska et al. 2014 [40])

 ${\bf Configuration}\ \ {\rm to}\ {\rm fill}$

CHAPTER

SEVEN

OUTPUT FILES

7.1 Runtime diagnostic information

7.1.1 Error messages: problems.txt

see this Output files (page 157)

If there are problems running the program serious error messages will be written to problems.txt.

- Serious problems will usually cause the program to stop after writing the error message. If this is the case, the last line of problems.txt will contain a non-zero number (the error code).
- If the program runs successfully, problems.txt file ends with:

```
Run completed.
```

SUEWS has a large number of error messages included to try to capture common errors to help the user determine what the problem is. If you encounter an error that does not provide an error message please capture the details so we can hopefully provide better error messages in future.

See *Troubleshooting* (page ??) section for help solving problems. If the file paths are not correct the program will return an error when run (see *Preparing to run the model* (page ??)).

7.1.2 Warning messages: warnings.txt

- If the program encounters a more minor issue it will not stop but a warning may be written to warnings.txt. It is advisable to check the warnings to ensure there is not a more serious problem.
- The warnings.txt file can be large (over several GBs) given warning messages are written out during a large scale simulation, you can use tail/head to view the ending/starting part without opening the whole file on Unix-like systems (Linux/mac OS), which may slow down your system.
- To prevent warnings.txt from being written, set **SuppressWarnings** to 1 in RunControl.nml (page ??).
- Warning messages are usually written with a grid number, timestamp and error count. If the problem occurs in the initial stages (i.e. before grid numbers and timestamps are assigned, these are printed as 00000).

7.1.3 Summary of model parameters: SS_FileChoices.txt

For each run, the model parameters specified in the input files are written out to the file SS_FileChoices.txt.

7.2 Model output files

7.2.1 SSss_YYYY_TT.txt

SUEWS produces the main output file (SSss_YYYYY_tt.txt) with time resolution (TT min) set by **ResolutionFilesOut** in *RunControl* (page ??).

Before these main data files are written out, SUEWS provides a summary of the column names, units and variables included in the file Ss_YYYY_TT_OutputFormat.txt (one file per run).

The variables included in the main output file are determined according to WriteOutOption (page 30) set in RunControl.nml (page 21).

| Column | Name | WriteOutOption | Description |
|--------|-----------|----------------|--|
| 1 | Year | 0,1,2 | Year [YYYY] |
| 2 | DOY | 0,1,2 | Day of year [DOY] |
| 3 | Hour | 0,1,2 | Hour [H] |
| 4 | Min | 0,1,2 | Minute [M] |
| 5 | Dectime | 0,1,2 | Decimal time [-] |
| 6 | Kdown | 0,1,2 | Incoming shortwave radiation [W m -2] |
| 7 | Kup | 0,1,2 | Outgoing shortwave radiation [W m -2] |
| 8 | Ldown | 0,1,2 | Incoming longwave radiation [W m -2] |
| 9 | Lup | 0,1,2 | Outgoing longwave radiation [W m -2] |
| 10 | Tsurf | 0,1,2 | Bulk surface temperature [°C] |
| 11 | QN | 0,1,2 | Net all-wave radiation [W m -2] |
| 12 | QF | 0,1,2 | Anthropogenic heat flux [W m -2] |
| 13 | QS | 0,1,2 | Storage heat flux [W m -2] |
| 14 | QH | 0,1,2 | Sensible heat flux (calculated using SUEWS) [W m -2] |
| 15 | QE | 0,1,2 | Latent heat flux (calculated using SUEWS) [W m -2] |
| 16 | QHlumps | 0,1 | Sensible heat flux (calculated using LUMPS) [W m -2] |
| 17 | QElumps | 0,1 | Latent heat flux (calculated using LUMPS) [W m -2] |
| 18 | QHresis | 0,1 | Sensible heat flux (calculated using resistance method) [W m -2] Do not use |
| 19 | Rain | 0,1,2 | Rain [mm] |
| 20 | Irr | 0,1,2 | Irrigation [mm] |
| 21 | Evap | 0,1,2 | Evaporation [mm] |
| 22 | RO | 0,1,2 | Runoff [mm] |
| 23 | TotCh | 0,1,2 | Change in surface and soil moisture stores [mm] |
| 24 | SurfCh | 0,1,2 | Change in surface moisture store [mm] |
| 25 | State | 0,1,2 | Surface wetness state [mm] |
| 26 | NWtrState | 0,1,2 | Surface wetness state (for non-water surfaces) [mm] |
| 27 | Drainage | 0,1,2 | Drainage [mm] |
| 28 | SMD | 0,1,2 | Soil moisture deficit [mm] |
| 29 | FlowCh | 0,1 | Additional flow into water body [mm] |
| 30 | AddWater | 0,1 | Additional water flow received from other grids [mm] |
| 31 | ROSoil | 0,1 | Runoff to soil (sub-surface) [mm] |
| 32 | ROPipe | 0,1 | Runoff to pipes [mm] |
| 33 | ROImp | 0,1 | Above ground runoff over impervious surfaces [mm] |
| 34 | ROVeg | 0,1 | Above ground runoff over vegetated surfaces [mm] |
| 35 | ROWater | 0,1 | Runoff for water body [mm] |
| 36 | WUInt | 0,1 | Internal water use [mm] |
| 37 | WUEveTr | 0,1 | Water use for irrigation of evergreen trees [mm] |

7.2.2 SSss_YYYY_nn_TT.nc

UEWS can also produce the main output file in netCDF format by setting ncMode=1 (set in RunControl (page ??)).

As the date and time information is incorporated in the netCDF output as separate dimension, the first five variables in the normal text output file (in .txt) are not included in the netCDF output but other variables are all kept.

N.B., considering the file size limit by the classic netCDF format, the output frequency is determined automatically by the internal SUEWS program setting to avoid the oversize problem in the netCDF files.

7.2.3 SSss_DailyState.txt

Contains information about the state of the surface and soil and vegetation parameters at a time resolution of one day. One file is written for each grid so it may contain multiple years.

7.2.4 InitialConditionsSSss_YYYY.nml

At the end of the model run (or the end of each year in the model run) a new InitialConditions file is written out (to the input folder) for each grid, see InitialConditionsSSss_YYYY.nml

7.2.5 SSss_YYYY_snow_TT.txt

SUEWS produces a separate output file for snow (when snowUse = 1 in RunControl.nml) with details for each surface type.

File format of SSss_YYYY_snow_60.txt

| Column | Name | Description |
|--------|-----------|---|
| 1 | iy | Year [YYYY] |

7.2.6 SSss_YYYY_BL.txt

Meteorological variables modelled by CBL portion of the model are output in to this file created for each day with time step (see section CBL Input).

| Column | Name | Description | Units |
|--------|-----------|--|---------------|
| 1 | iy | Year [YYYY] | |
| 2 | id | Day of year [DoY] | |
| 3 | it | Hour [H] | |
| 4 | imin | Minute [M] | |
| 5 | dectime | Decimal time [-] | |
| 6 | zi | Convectibe boundary layer height | m |
| 7 | Theta | Potential temperature in the inertial sublayer | K |
| 8 | Q | Specific humidity in the inertial sublayer | g kg -1 |
| 9 | theta+ | Potential temperature just above the CBL | K |
| 10 | q+ | Specific humidity just above the CBL | g kg -1 |
| 11 | Temp_C | Air temperature | °C |
| 12 | RH | Relative humidity | % |
| 13 | QH_use | Sensible heat flux used for calculation | W m -2 |
| 14 | QE_use | Latent heat flux used for calculation | W m -2 |
| 15 | Press_hPa | Pressure used for calculation | hPa |
| 16 | avu1 | Wind speed used for calculation | m s -1 |
| 17 | ustar | Friction velocity used for calculation | m s -1 |
| 18 | avdens | Air density used for calculation | kg m -3 |
| 19 | lv_J_kg | Latent heat of vaporization used for calculation | J kg -1 |
| 20 | avcp | Specific heat capacity used for calculation | J kg -1 K -1 |
| 21 | gamt | Vertical gradient of potential temperature | K m -1 |
| 22 | gamq | Vertical gradient of specific humidity | kg kg -1 m -1 |

7.2.7 SOLWEIGpoiOut.txt

Calculated variables from POI, point of interest (row, col) stated in SOLWEIGinput.nml.

 ${\bf SOLWEIG\ model\ output\ file\ format:\ SOLWEIGpoiOUT.txt}$

| Column | Name | Description | Units |
|--------|------------|---|----------------------|
| 1 | id | Day of year | |
| 2 | dectime | Decimal time | |
| 3 | azimuth | Azimuth angle of the Sun | 0 |
| 4 | altitude | Altitude angle of the Sun | 0 |
| 5 | GlobalRad | Input Kdn | W m -2 |
| 6 | DiffuseRad | Diffuse shortwave radiation | W m -2 |
| 7 | DirectRad | Direct shortwave radiation | W m -2 |
| 8 | Kdown2d | Incoming shortwave radiation at POI | W m -2 |
| 9 | Kup2d | Outgoing shortwave radiation at POI | W m -2 |
| 10 | Ksouth | Shortwave radiation from south at POI | W m -2 |
| 11 | Kwest | Shortwave radiation from west at POI | W m -2 |
| 12 | Knorth | Shortwave radiation from north at POI | W m -2 |
| 13 | Keast | Shortwave radiation from east at POI | W m -2 |
| 14 | Ldown2d | Incoming longwave radiation at POI | W m -2 |
| 15 | Lup2d | Outgoing longwave radiation at POI | W m -2 |
| 16 | Lsouth | Longwave radiation from south at POI | W m -2 |
| 17 | Lwest | Longwave radiation from west at POI | W m -2 |
| 18 | Lnorth | Longwave radiation from north at POI | W m -2 |
| 19 | Least | Longwave radiation from east at POI | W m -2 |
| 20 | Tmrt | Mean Radiant Temperature | $^{\circ}\mathrm{C}$ |
| 21 | 10 | theoretical value of maximum incoming solar radiation | W m -2 |
| 22 | CI | clearness index for Ldown (Lindberg et al. 2008) | |
| 23 | gvf | Ground view factor (Lindberg and Grimmond 2011) | |
| 24 | shadow | Shadow value ($0 = \text{shadow}, 1 = \text{sun}$) | |
| 25 | svf | Sky View Factor from ground and buildings | |
| 26 | svfbuveg | Sky View Factor from ground, buildings and vegetation | |
| 27 | Ta | Air temperature | $^{\circ}\mathrm{C}$ |
| 28 | Tg | Surface temperature | $^{\circ}\mathrm{C}$ |

7.2.8 SSss_YYYY_ESTM_TT.txt

If the ESTM model option is run, the following output file is created. Note: First time steps of storage output could give NaN values during the initial converging phase.

ESTM output file format

| Column | Name | Description | Units |
|--------|----------|---|--------|
| 1 | iy | Year | |
| 2 | id | Day of year | |
| 3 | it | Hour | |
| 4 | imin | Minute | |
| 5 | dectime | Decimal time | |
| 6 | QSnet | Net storage heat flux (QSwall+QSground+QS) | W m -2 |
| 7 | QSair | Storage heat flux into air | W m -2 |
| 8 | QSwall | Storage heat flux into wall | W m -2 |
| 9 | QSroof | Storage heat flux into roof | W m -2 |
| 10 | QSground | Storage heat flux into ground | W m -2 |
| 11 | QSibld | Storage heat flux into internal elements in buildling | W m -2 |
| 12 | Twall1 | Temperature in the first layer of wall (outer-most) | K |

Table 7.4 – continued from previous page

| Column | Name | Description | Units |
|--------|----------|---|-------|
| 13 | Twall2 | Temperature in the first layer of wall | K |
| 14 | Twall3 | Temperature in the first layer of wall | K |
| 15 | Twall4 | Temperature in the first layer of wall | K |
| 16 | Twall5 | Temperature in the first layer of wall (inner-most) | K |
| 17 | Troof1 | Temperature in the first layer of roof (outer-most) | K |

TROUBLESHOOTING

8.1 How to create a directory?

please search the web using this phrase if you do not know how to create a folder or directory

8.2 How to unzip a file

please search the web using this phrase if you do not know how to unzip a file

8.3 A text editor

is a program to edit plain text files. If you search on the web using the phrase 'text editor' you will find numerous programs. These include for example, NotePad, EditPad, Text Pad etc

8.4 Command prompt

From Start select run –type cmd – this will open a window. Change directory to the location of where you stored your files. The following website may be helpful if you do not know what a command prompt is: http://dosprompt.info/

8.5 Day of year [DOY]

January 1st is day 1, February 1st is day 32. If you search on the web using the phrase 'day of year calendar' you will find tables that allow rapid conversions. Remember that after February 28th DOY will be different between leap years and non-leap years.

8.6 ESTM output

First time steps of storage output could give NaN values during the initial converging phase.

8.7 First things to Check if the program seems to have problems

- Check the problems.txt file.
- Check file options in RunControl.nml.
- Look in the output directory for the SS_FileChoices.txt. This allows you to check all options that were used in the run. You may want to compare it with the original version supplied with the model.
- Note there can not be missing time steps in the data. If you need help with this you may want to checkout UMEP

8.7.1 A pop-up saying "file path not found"

This means the program cannot find the file paths defined in RunControl.nml file. Possible solutions:

- Check that you have created the folder that you specified in RunControl.nml.
- Check does the output directory exist?
- Check that you have a single or double quotes around the FileInputPath, FileOutputPath and FileCode

===="%sat_vap_press.f temp=0.0000 pressure dectime"==== Temperature is zero in the calculation of water vapour pressure parameterization.

- You don't need to worry if the temperature should be (is) 0°C.
- If it should not be 0°C this suggests that there is a problem with the data.

8.7.2 %T changed to fit limits

• [TL =0.1]/ [TL =39.9] You may want to change the coefficients for surface resistance. If you have data from these temperatures, we would happily determine them.

8.7.3 %Iteration loop stopped for too stable conditions.

• [zL]/[USTAR] This warning indicates that the atmospheric stability gets above 2. In these conditions MO theory is not necessarily valid. The iteration loop to calculate the Obukhov length and friction velocity is stopped so that stability does not get too high values. This is something you do not need to worry as it does not mean wrong input data.

8.7.4 "Reference to undefined variable, array element or function result"

• Parameter(s) missing from input files.

See also the error messages provided in problems.txt and warnings.txt

8.7.5 Email list

ACKNOWLEDGEMENTS

- People who have contributed to the development of SUEWS (plus co-authors of papers):
- Current contributors:
 - Prof C.S.B. Grimmond (University of Reading; previously Indiana University, King's College London, UK); Dr Leena Järvi (University of Helsinki, Finland); Dr Helen Ward (University of Reading), Dr Fredrik Lindberg (Göteborg University, Sweden), Dr Andy Gabey (Reading), Dr Ting SUN (Reading), Dr Jie PENG (SIMS), Dr Natalie Theeuwes (Reading),
- Past Contributors:
 - Dr Brian Offerle (Indiana University), Dr Thomas Loridan (King's College London), Dr Shiho
 Onomura (Göteborg University, Sweden)
- Users who have brought things to our attention to improve this manual and the model:
 - Dr Andy Coutts (Monash University, Australia), Kerry Nice (Monash University, Australia),
 Shiho Onomura (Göteborg University, Sweden), Dr Stefan Smith (University of Reading, UK),
 Dr Helen Ward (King's College London, UK; University of Reading, UK);
 Duick Young (King's College London),
 Dr Ning Zhang (Nanjing University, China)
- Funding to support development:
 - National Science Foundation (USA, BCS-0095284, ATM-0710631), EU Framework 7 BRIDGE (211345), EUf7 emBRACE; UK Met Office; NERC ClearfLo, NERC/Belmont TRUC, Newton/Met Office CSSP-China, H2020 UrbanFluxes, EPSRC LoHCool

- 2. Recommendations, Errors, Help/Updates please join our email list
 - (a) www.lists.reading.ac.uk/mailman/listinfo/met-suews
 - (b) As UMEP has a number of tools to support SUEWS you may want to join that list also www.lists.reading.ac.uk/mailman/listinfo/met-umep

VERSION HISTORY

12.1 New in SUEWS Version 2018a

see Version History (page 175).

12.2 New in SUEWS Version 2017b (released 2 August 2017)

PDF Manual for v2017b

- 1. Surface-level diagnostics: T2 (air temperature at 2 m agl), Q2 (air specific humidity at 2 m agl) and U10 (wind speed at 10 m agl) added as default output.
- 2. Output in netCDF format. Please note this feature is **NOT** enabled in the public release due to the dependency of netCDF library. Assistance in enabling this feature may be requested to the development team via SUEWS mail list.
- 3. Edits to the manual.
- 4. New capabilities being developed, including two new options for calculating storage heat flux (AnOHM, ESTM) and modelling of carbon dioxide fluxes. These are currently under development and **should not be used** in v2017b.
- 5. Known issues
 - (a) BLUEWS parameters need to be checked
 - (b) Observed soil moisture can not be used as an input
 - (c) Wind direction is not currently downscaled so non -999 values will cause an error.

12.3 New in SUEWS Version 2017a (Feb 2017)

- 1. Changes to input file formats (including RunControl.nml and InitialConditions files) to facilitate setting up and running the model. Met forcing files no longer need two rows of -9 at the end to indicate the end of the file.
- 2. Changes to output file formats (now option to write out only a subset of variables, rather than all variables).
- 3. SUEWS can now disaggregate forcing files to the model time-step and aggregate output at the model time-step to lower resolution. This removes the need for the python wrapper used with previous versions.

- 4. InitialConditions format and requirements changed. A single file can now be provided for multiple grids. SUEWS will approximate most (but not all) of the required initial conditions if values are unknown. (However, if detailed information about the initial conditions is known, this can still be provided to and used by SUEWS.)
- 5. Leaf area index calculations now use parameters provided for each vegetated surface (previously only the deciduous tree LAI development parameters were applied to all vegetated surfaces).
- 6. For compatibility with GIS, the sign convention for longitude has been changed. Now negative values are to the west, positive values are to the east. Note this appears to have been incorrectly coded in previous versions (but may not necessarily have been problematic).
- 7. Storage heat flux calculation adapted for shorter (sub-hourly) model time-step: hysteresis calculation now based on running means over the previous hour.
- 8. Improved error handling, including separate files for serious errors (problems.txt) and less critical issues (warnings.txt).
- 9. Edits to the manual.
- 10. New capabilities being developed, including two new options for calculating storage heat flux (AnOHM, ESTM) and modelling of carbon dioxide fluxes. These are currently under development and **should** not be used in v2017a.

12.4 New in SUEWS Version 2016a (released 21 June 2016)

PDF Manual for v2016a

- Major changes to the input file formats to facilitate the running of multiple grids and multiple years. Surface characteristics are provided in SiteSelect.txt and other input files are cross-referenced via codes or profile types.
- 2. The surface types have been altered:
 - Previously, grass surfaces were entered separately as irrigated grass and unirrigated grass surfaces, whilst the 'unmanaged' land cover fraction was assumed by the model to behave as unirrigated grass. There is now a single surface type for grass (total for irrigated plus unirrigated) and a new bare soil surface type.
 - The proportion of irrigated vegetation must now be specified for grass, evergreen trees and deciduous trees individually.
- 3. The entire model now runs at a time step specified by the user. Note that 5 min is strongly recommended. (Previously only the water balance calculations were done at 5 min with the energy balance calculations at 60 min).
- 4. Surface conductance now depends on the soil moisture under the vegetated surfaces only (rather than the total soil moisture for the whole study area as previously).
- 5. Albedo of evergreen trees and grass surfaces can now change with leaf area index as was previously possible for deciduous trees only.
- 6. New suggestions in Troubleshooting section.
- 7. Edits to the manual.
- 8. CBL model included.
- 9. SUEWS has been incorporated into UMEP

12.5 New in SUEWS Version 2014b (released 8 October 2014)

V2014 manual These affect the run configuration if previously run with older versions of the model:

- 1. New input of three additional columns in the Meteorological input file (diffusive and direct solar radiation, and wind direction)
- 2. Change of input variables in InitialConditions.nml file. Note we now refer to CT as ET (ie. Evergreen trees rather than coniferous trees)
- 3. In GridConnectionsYYYY.txt, the site names should now be without the underscore (e.g "Sm" and not "Sm_")

Other issues:

- 1. Number of grid areas that can be modelled (for one grid, one year 120; for one grid two years 80)
- 2. Comment about Time interval of input data
- 3. Bug fix: Column headers corrected in 5 min file
- 4. Bug fix: Surface state 60 min file corrected to give the last 5 min of the hour (rather than cumulating through the hour)
- 5. Bug fix: units in the Horizontal soil water transfer
- 6. ErrorHints: More have been added to the problems.txt file.
- 7. Manual: new section on running the model appropriately
- 8. Manual: notation table updated
- 9. Possibility to add snow accumulation and melt: new paper

Järvi L, Grimmond CSB, Taka M, Nordbo A, Setälä H, and Strachan IB 2014: Development of the Surface Urban Energy and Water balance Scheme (SUEWS) for cold climate cities, Geosci. Model Dev. 7, 1691-1711, doi:10.5194/gmd-7-1691-2014.

12.6 New in SUEWS Version 2014a.1 (released 26 February 2014)

- 1. Please see the large number of changes made in the 2014a release.
- 2. This is a minor change to address installing the software.
- 3. Minor updates to the manual

12.7 New in SUEWS Version 2014a (released 21 February 2014)

- 1. Bug fix: External irrigation is calculated as combined from automatic and manual irrigation and during precipitation events the manual irrigation is reduced to 60% of the calculated values. In previous version of the model, the irrigation was in all cases taken 60% of the calculated value, but now this has been fixed.
- 2. In previous versions of the model, irrigation was only allowed on the irrigated grass surface type. Now, irrigation is also allowed on evergreen and deciduous trees/shrubs surfaces. These are not however treated as separate surfaces, but the amount of irrigation is evenly distributed to the whole surface type in the modelled area. The amount of water is calculated using same equation as for grass surface

- (equation 5 in Järvi et al. 2011), and the fraction of irrigated trees/shrubs (relative to the area of tree/shrubs surface) is set in the gis file (See Table 4.11: SSss_YYYY.gis)
- 3. In the current version of the model, the user is able to adjust the leaf-on and leaf-off lengths in the FunctionalTypes. nml file. In addition, user can choose whether to use temperature dependent functions or combination of temperature and day length (advised to be used at high-latitudes)
- 4. In the gis-file, there is a new variable Alt that is the area altitude above sea level. If not known exactly use an approximate value.
- 5. Snow removal profile has been added to the HourlyProfileSSs_YYYY.txt. Not yet used!
- 6. Model time interval has been changed from minutes to seconds. Preferred interval is 3600 seconds (1 hour)
- 7. Manual correction: input variable Soil moisture said soil moisture deficit in the manual word removed
- 8. Multiple compiled versions of SUEWS released. There are now users in Apple, Linux and Windows environments. So we will now release compiled versions for more operating systems (section 3).
- 9. There are some changes in the output file columns so please, check the respective table of each used output file.
- 10. Bug fix: with very small amount of vegetation in an area impacted Phenology for LUMPS

12.8 New in SUEWS Version 2013a

- 1. Radiation selection bug fixed
- 2. Aerodynamic resistance when very low no longer reverts to neutral (which caused a large jump) but stays low
- 3. Irrigation day of week fixed
- 4. New error messages
- 5. min file now includes a decimal time column see Section 5.4 Table 5.3

12.9 New in SUEWS Version 2012b

- 1. Error message generated if all the data are not available for the surface resistance calculations
- 2. Error message generated if wind data are below zero plane displacement height.
- 3. All error messages now written to 'Problem.txt' rather than embedded in an ErrorFile. Note some errors will be written and the program will continue others will stop the program.
- 4. Default variables removed (see below). Model will stop if any data are problematic. File should be checked to ensure that reasonable data are being used. If an error occurs when there should not be one let us know as it may mean we have made the limits too restrictive.

Contents no longer used File default Fcld=0.1 default Pres=1013 default RH=50 default T=10 default U=3 RunControl.nml

- Just delete lines from file
- Values you had were likely different from these example value shown here

12.10 New in SUEWS Version 2012a

- 1. Improved error messages when an error is encountered. Error message will generally be written to the screen and to the file 'problems.txt'
- 2. Format of all input files have changed.
- 3. New excel spreadsheet and R programme to help prepare required data files. (Not required)
- 4. Format of coef flux (OHM) input files have changed.
 - This allows for clearer identification for users of the coefficients that are actually to be used
 - This requires an additional file with coefficients. These do not need to be adjusted but new coefficients can be added. We would appreciate receiving additional coefficients so they can be included in future releases Please email Sue.
- 5. Storage heat flux (OHM) coefficients can be changed by
 - time of year (summer, winter)
 - surface wetness state
- 6. New files are written: DailyState.txt
 - Provides the status of variables that are updated on a daily or basis or a snapshot at the end of each day.
- 7. Surface Types
 - Clarification of surface types has been made. See GIS and OHM related files

12.11 New in SUEWS Version2011b

- 1. Storage heat flux (ΔQs) and anthropogenic heat flux (QF) can be set to be 0 W m⁻²
- 2. Calculation of hydraulic conductivity in soil has been improved and HydraulicConduct in SUEWSIn-put.nml is replaced with name SatHydraulicConduct
- 3. Following removed from HeaderInput.nml
 - HydraulicConduct
 - GrassFractionIrrigated
 - PavedFractionIrrigated
 - TreeFractionIrrigated

The lower three are now determined from the water use behaviour used in SUEWS

- 1. Following added to HeaderInput.nml
 - SatHydraulicConduct
 - defaultQf
 - defaultQs
- 2. If ΔQs and QF are not calculated in the model but are given as an input, the missing data is replaced with the default values.
- 3. Added to SAHP input file

 • AHDIUPRF – diurnal profile used if AnthropHeatChoice = 1 V2012a this became obsolete OHM file (SSss_YYYY.ohm)

DIFFERENCES BETWEEN SUEWS, LUMPS AND FRAISE

The largest difference between LUMPS and SUEWS is that the latter simulates the urban water balance in detail while LUMPS takes a simpler approach for the sensible and latent heat fluxes and the water balance ("water bucket"). The calculation of evaporation/latent heat in SUEWS is more biophysically based. Due to its simplicity, LUMPS requires less parameters in order to run. SUEWS gives turbulent heat fluxes calculated with both models as an output. The model can run LUMPS alone without running SUEWS (Table 4.1 – SuewsStatus).

Similarities and differences between LUMPS and SUEWS.

| | LUMPS | SUEWS |
|--------------------|---------------------------|---|
| Net all-wave radi- | Input or NARP | Input or NARP |
| ation (Q^*) | | |
| Storage heat flux | Input or from OHM | Input or from OHM |

| Anthropogenic | Input or calculated | Input or calculated |
| heat flux (QF) | | |
| Latent heat (QE) | DeBruin and Holtslag | Penman-Monteith equation2 |
| | (1982) | |
| Sensible heat flux | DeBruin and Holtslag | Residual from available energy minus QE |
| (QH) | (1982) | |
| Water balance | No water balance included | Running water balance of canopy and water balance |
| | | of soil |
| Soil moisture | Not considered | Modelled |
| Surface wetness | Simple water bucket model | Running water balance |
| Irrigation | Only fraction of surface | Input or calculated with a simple model |
| | area that is irrigated | |
| Surface cover | buildings, paved, vegeta- | buildings, paved, coniferous and deciduous |
| | tion | trees/shrubs, irrigated and unirrigated grass |
| | | |

13.1 FRAISE Flux Ratio – Active Index Surface Exchange

FRAISE provides an estimate of mean midday (± 3 h around solar noon) energy partitioning from information on the surface characteristics and estimates of the mean midday incoming radiative energy and anthropogenic heat release. Please refer to Loridan and Grimmond (2012) [LG2012] (page 185) for further details.

| Topic | FRAISE | LUMPS | SUEWS |
|-------------|------------------------|----------------------|-------------------------------------|
